DMR 8	Page 30: The sentence "Environmental legislation that applies to Oil and Gas (O&G) activities within the Falkland Islands is based upon the regulatory requirements for the United Kingdom Continental Shelf (UKCS)." could perhaps be better reworded as "Falkland Islands environmental	Thank you for your comment. This is noted and the text will be amended.	Section 1.3.1

Reference	Request for information	Navitas response	Addressed
	legislation that applies to Oil and Gas (O&G) activities is largely based upon the regulatory requirements for the United Kingdom Continental Shelf (UKCS)." as the original wording could be read as UK law being applied in the Falklands, whereas the Falkland Islands has its own legislation.		
DMR 9	Page 30: The Offshore Petroleum (Licensing) Regulations 2000 is a standalone piece of legislation, not an amendment to the 1995 regulations, and should be listed separately	Thank you for your comment. This is noted and the text will be amended.	Section 1.3.1
DMR 10	Page 31: In the final paragraph, it would be helpful to state how many wells will need to be drilled to start production, and how many will be drilled during the SIMOPS period.	Thank you for your comment. This is noted and a summary will be added.	Section 1.5.1.1
DMR 11	Page 34: References “remote GI well(s)” but earlier states there will be only one.	The reason for the ‘(s)’ is to indicate that while there will only be one completed and functioning GI well, two may actually be drilled should the first one be insufficient. However, the sentence in question is referring to the operational GI well of which there will be only one and the sentence will be updated to reflect this.	Section 1.5.1.4
DMR 12	Page 34: References a single tanker – perhaps should be plural to make it clear there will not only be one tanker offloading from the FPSO?	Thank you for your comment. This is noted and wording will be checked for clarity.	Section 1.5.1.5
DMR 13	Page 36: There are no local authorities in the Falklands – it is presumed this refers to FIG?	Thank you for your comment. This is noted and the text will be amended.	Section 1.5
DMR 14	Page 42: Table 1.4 references two types of fisheries but gives three catches by weight (49.5%, 25.1% and 5.2%). The missing one appears to be Patagonian rock cod (which is 5.2% of the 2013-2022 catch).	Thank you for your comment. This is noted and the text will be amended.	Section 1.6
DMR 15	Page 45: In the Project Activities section of figure 1-3: • Why is there onshore helicopter disturbance from oil export but not other project phases? • Will there not be underwater noise from subsea works or oil export (e.g., from the tankers)? The text on page 672 on noise scenarios includes the installation of subsea infrastructure, while on page 656 CTTs are included as	Thank you for your comment. This is noted and Figure 1-3 will be reviewed and updated as necessary.	Section 1.8.1 Figure 1-3

Reference	Request for information	Navitas response	Addressed
	sources of underwater noise. • Oil export will have atmospheric emissions from tankers. In the Environmental aspects section: • Would atmospheric emissions not affect regional air quality (particulates etc)? • Would increased vessel presence not affect seabirds? • Would seabed disturbance not affect archaeology? • Other users of the sea could be affected by competition for onshore resource if they also use onshore facilities		
DMR 16	Page 47: The "(see section 1.7.3)" is self-referencing	Thank you for your comment. This is noted and the text will be amended.	Section 1.8.3
DMR 17	Page 47: Table 2.8 is referenced but does not exist	Thank you for your comment. This is noted and the text will be amended.	Section 1.8.3.1
DMR 18	Page 51: In table 1.6 the section numbers are wrong for "Behavioural disturbance to marine mammals from underwater noise offshore" (should be 10.4) and "Impacts of drill cuttings discharge" (should be 10.6).	Thank you for your comment. This is noted and the text will be amended.	Section 1.8.4.2
DMR 19	Page 52: It would be helpful to note here and in other locations (such as 4.5.1 and 5.4) that details of what Non-Aqueous Drill Fluid is composed of are given in section 10.6.4.1.3.1	Thank you for your comment. This is noted and reference to the relevant section will be added.	Section 1.8.4.2.3 Section 4.5.2
DMR 20	Page 53: Regarding the carbon intensity figures given, it should be mentioned that these are a worst-case, not the expected case. It would also be preferable to reference Falkland Islands emissions rather than UK emissions, as this is not a UK development.	The NTS summary will be updated to clarify this and to include reference to the Falkland Island emissions, although as in the body of the EIS this will be caveated with the fact that the Falkland's Islands data set is incomplete and currently omits some big contributors (e.g., air traffic, fishing, aviation).	Section 1.8.4.2.4
DMR 21	Page 57: While Falkland Islands law requires well designs to be peer reviewed by an independent well examiner, it is not a legal requirement for them to be reviewed by the UK HSE, although this may be considered good practice.	Thank you for your comment. This is noted and the text will be amended to clarify. Previous DMR guidance and practice has been that PON4 applications to drill, including well designs and	Section 1.8.4.3.1

Reference	Request for information	Navitas response	Addressed
		geological well evaluations, have been reviewed by DMR with support from UK HSEx and BGS.	
DMR 22	Page 58: AIS is mentioned but the initialism is not explained until the following page.	Thank you for your comment. This is noted and the text will be amended.	Section 1.8.4.3.1
DMR 23	Page 61: Table 1.7 does not appear to be consistent with the environmental impacts identified in figure 1-3 – for example, artificial light was identified as having an impact on marine mammals and human populations in figure 1-3, but these are not rated in table 1.7. Similarly, seabed disturbance was identified as affecting water quality in 1-3 but not rated in 1.7. There are many other such inconsistencies between the table and figure.	Thank you for your comment. These will be checked and cross-referenced and updated where necessary.	Section 1.8.5 Figure 1-3 Table 1.8 Table 13.2
DMR 24	Page 66: An EMMP group is referenced but not defined. Who would this include? Assume FIG, Navitas and possibly relevant stakeholders?	Thank you for your comment. Please refer to the EMMP Workshop Report (April 2019). Please also refer to EIS Section 15.5 on EIS Governance. Navitas will expand the information on the EMMP governance and advisory group provided in Ch15 in the post-consultation EIS to ensure it is clear.	Section 1.9.3
DMR 25	Page 68: “Implementation of the Biosecurity Management Plan (BMP)” should also be listed in the “Introduction of non-native marine species” row, as (according to p108) it appears to be intended to cover both.	Thank you for your comment. This is noted and the text will be amended.	Section 1.9.3 Table 1.10
DMR 26	Page 74: Figure 2-1 is extremely low quality.	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	All Figures checked for resolution and improved where possible
DMR 27	Page 75: It would be helpful to state how many wells are expected in each stage.	Thank you for your comment. This is noted and will be added.	Section 2.2.3.1
DMR 28	Page 76: The second paragraph mentions an exclusion zone and references figure 2-2, but the figure does not show an exclusion zone.	Thank you for your comment. This is noted and the reference to the figure will be removed.	Section 2.2.3.2

Reference	Request for information	Navitas response	Addressed
DMR 29	Page 76: It would be helpful to explain what “treated seawater” is.	Thank you for your comment. This is noted and the text will be amended.	Section 2.2.3.3
DMR 30	Page 77: MRSV is mentioned for the first time but not explained.	Thank you for your comment. This is noted and the text will be amended.	Section 2.2.3.5
DMR 31	Page 79: The scope of the EIA now also includes emissions from use of the oil.	Thank you for your comment. This is noted and the text will be amended.	Section 2.4
DMR 32	Page 80: The text references a decommissioning-specific EIA being “in accordance with the approach taken in the UK with regard to developments on the UK continental Shelf (UKCS) and the DECC (now BEIS) Decommissioning Guidelines (BEIS, 2018)).” However, the Falkland Islands will have its own requirements. The reference to BEIS (in red) should now be DEZNZ.	Thank you for your comment. This is noted and the text will be amended.	Section 2.4
DMR 33	Page 81: Table 2.1 is missing the offsetting section.	Thank you for your comment. This is noted and the text will be amended.	Section 2.5.1
DMR 34	Page 91: The Offshore Petroleum (Licensing) Regulations 2000 is a standalone piece of legislation, not an amendment to the 1995 regulations, and should be listed separately.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.3
DMR 35	Page 92: FIG is not planning to repeal the 1994 OMO. There will be a new Safety and Environment Ordinance and the 1994 OMO will be amended. to remove the safety and environmental areas covered by the new bill and updated to cover other areas as required.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.3.1
DMR 36	Page 93: The new legislation will not “align with UK best practice” – the aim is to bring in standards at least as high as the UK and may go further than the UK in some areas.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.3.1
DMR 37	Page 93: As per the record of Law and Regulations- the 1995 Regulations were never amended. However, the 2000 Regulations were amended. subsequently in 2004, 2005 and 2009.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.3.2
DMR 38	Page 93: The relevant enactment is Falkland Islands (Continental Shelf) Proclamation 1991. There is no ordinance to this effect.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.3.3

Reference	Request for information	Navitas response	Addressed
DMR 39	Page 95: The Falkland Islands Environmental Trust Ordinance 2021 has yet to be commenced.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.3.17
DMR 40	Page 96: One PON has been missed off the list: PON11 - Loss or dumping of materials at sea from offshore oil and gas installations.	Thank you for your comment. This is noted and the text will be amended.	Section 3.1.7.4
DMR 41	Page 100: In item 3 of table 3.2, "the provision of appropriate resources to meet objectives are available delivering a sustainable and predictable business outcome" does not seem to make sense. Similarly, "Change into our organisation is managed" in item 8 may be an error.	Thank you for your comment. This is noted and the wording will be amended to clarify.	Section 3.2.1.1
DMR 42	Page 107: It would be useful to say who the key stakeholders that have been identified are (or confirm that they are the ones listed in table 6-2)	Thank you for your comment. This is noted and the text will be amended.	Section 3.2.17
DMR 43	Page 107: The timing of the OPEPs is a bit unclear. It is expected they are available around the same time as the EIS is published for consultation (the EIS guidance recommends they are published at the same time as the EIS), but the text refers to them being "developed during the Execute stage"	Thank you for your comment. The preliminary OPEPs were submitted to FIG in August 2024. Prior to the commencement of operations, the OPEPs will be updated and supplemented in order to produce operational OPEPs. They will have an approved lifespan of five years from the date of first approval by FIG and shall be submitted in their entirety for re-approval 2 months before that time.	N/A
DMR 44	Page 111: It says that "Between 2012 and 2020, the relevant licences were owned by Premier" but then "POEPL was bought by Navitas Petroleum in September 2022" – what was the status between 2020 and 2022?	Thank you for your comment. The text will be clarified to explain that in 2020 the parent company of Premier Oil Exploration and Production Ltd (POEPL), Premier Oil and Chrysaor merged to form Harbour Energy Plc. Harbour Energy Plc then sold POEPL to Navitas Petroleum in September 2022.	Section 1.4 Section 2.1.1 Section 4.1
DMR 45	Page 113: The text states three options were shortlisted and then lists four options.	Thank you for your comment. This is noted and the text will be amended.	Section 4.3.2.1.1
DMR 46	Page 116: Why are emissions from fuel gas usage reported in megawatt thermal?	Thank you for your comment. This Chapter is on the consideration of alternatives and Table 4.3 shows only the screening differentiators between an FPSO and a TLP, both of which were considered by POEPL in	Table 4.4

Reference	Request for information	Navitas response	Addressed
		the early stages of the project development. The MWth figures simply indicate the likely thermal power of the two installations which has a bearing on the emissions. The table is not intended to indicate the actual emissions. Navitas recognise that the parameter ('Air Quality (emissions from fuel gas usage)') could be misleading and this will be changed to 'Thermal Power' and footnoted to explain that this is an indicator for potential fuel gas usage.	
DMR 47	Page 117: It is stated twice that table 4.4 covers seven key differences, but the table only contains six.	Thank you for your comment. This is noted and the text will be amended.	Section 4.3.2.1.1
DMR 48	Page 118: The table heading says seven key areas, but there are six.	Thank you for your comment. This is noted and the text will be amended.	Section 4.3.2.2.1
DMR 49	Page 119: The table references a 500m exclusion zone, but the exclusion zone will be 1,275m during operations (the 500m zone is for the MODU).	Thank you for your comment. This is noted and the text will be amended.	Section 4.3.2.2.1
DMR 50	Page 120: Table 4.5 twice mentions removing three vessels from the field, but it is not clear which vessels would be removed if a CTT is used rather than an FPSO.	Thank you for your comment. The comparison is made between 'Direct Offtake within the Sea Lion Field' and 'Ship to Ship transfers in Berkeley Sound' (which had been planned in a previous EIS but has since been discounted.) With ship to ship transfers in Berkeley Sound an Offshore Loading Shuttle Tanker (OLST) would have been required to carry the product from the FPSO to the awaiting CTT in Berkeley Sound, a launch would then have been required to take the pilots out to the OLST in Berkeley Sound and a tug to hold back the OLST. With the selected 'direct offtake' method, the OLST, the Berkeley Sound pilot boat and hold back tug are no longer required hence the reduction in 3 vessels.	N/A

Reference	Request for information	Navitas response	Addressed
DMR 51	Page 120: The previous EIS was not approved, it was accepted (FIG does not approve EISs).	Thank you for your comment. This is noted and the text will be amended.	Section 4.3.2.2.2
DMR 52	Page 121: The last sentence references document SBS-PLN-00001-05 but the latest version is SBS-PLN-00001-06.	Thank you for your comment. This is noted and the text will be amended.	Section 4.4.2.2
DMR 53	Page 123: It is stated in the section on mitigation measures not considered appropriate that an HP flare ignition was investigated but is not currently sufficiently proven. However, this contradicts information elsewhere stating that an automated ignition system will be investigated (table 1.9, section 10.1.10.1, 10.9.7, table 10.73, and is a commitment in the EMMP (15.7.2.1).	Thank you for your comment. This is noted and the text will be amended.	Section 4.5.4
DMR 54	Page 123: It states that the use of slick paints is being investigated, but section 4.5 is for mitigation measures that are not proposed for use and not considered appropriate. This should either be removed or the section description changed.	Thank you for your comment. This is noted and the text will be amended.	Section 4.5.6
DMR 55	Page 124: It is stated that “skimmers were not a viable response” to Sea Lion Crude. However, use of skimmers is still mentioned in the oil spill response sections 12.1.1.1.3, 12.1.4.4.6 and 12.1.4.6.2.	Thank you for your comment. This is noted and Navitas acknowledge that the EIS is not clear on the differentiation between the skimmer types and that the statement in Section 4.5.9 is misleading. The EIS will be updated for clarity and consistency. For Sea Lion crude, the CEDRE 2017 report states that 'oleophilic skimmers should not be recommended, as well as weir skimmers'. However, belt skimmers would be appropriate. This equipment is specified in the Preliminary OPEPs submitted to FIG. Note that weir skimming devices have been chosen to respond to MGO spills. The text will be clarified in the relevant sections of the EIS.	Section 4.5.10
DMR 56	Page 133: Inshore infrastructure is referenced in table 5.1, but there is no planned inshore infrastructure.	Thank you for your comment. This is noted and the text will be clarified.	Table 5.1

Reference	Request for information	Navitas response	Addressed
DMR 57	Page 135: Figure 5-2 is very low quality, making it quite hard to read (the colours of the pipelines is hard to follow).	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	All Figures checked for resolution and improved where possible
DMR 58	Page 141: What does “Once the produced water ‘breaks-through’” mean?	Thank you for your comment. This refers to the point at which the reservoir starts producing water as well as oil. The narrative will be updated to make this clearer.	Section 5.4.4
DMR 59	Pages 141-142: It is stated that there will be eight wells and then lists a possible nine. It may be best to reword to make it clearer that there may be more than eight.	Thank you for your comment. The potential 9th well states that this a contingency. However the text can be amended to reiterate there will ultimately be only one gas well and therefore eight functioning wells.	Section 5.4.4.1
DMR 60	Page 142: It would be helpful to note that details on what sweeps are composed of are given in section 10.6.4.1.3.1.	Thank you for your comment. This is noted and the text will be amended.	Section 5.4.4.4
DMR 61	Page 146: The first bullet point might be simpler to understand to the average reader if “a ‘kick’ of formation fluid” (neither term in red is defined in the document) was replaced with just “oil/gas”.	Thank you for your comment. This is noted and the text will be amended.	Section 5.4.5.3
DMR 62	Page 146: In the sentence “ensure that the concentration of NADF is less than 1 % by dry weight”, “NADF” should be “oil”.	Thank you for your comment. The narrative will be amended to state: “ensure that the oil concentration of NADF on cuttings is less than 1 % by dry weight”.	Section 5.4.5.3.1
DMR 63	Page 147: “If any cuttings are sampled that are not <1% by weight on cuttings” doesn’t seem to make sense.	The narrative will be amended to state: “If any cuttings are sampled and the concentration of entrained oil is not <1% by weight on cuttings”.	Section 5.4.5.3.1
DMR 64	Page 147: “mud pits” are referenced but not explained. Where are they located?	Thank you for your comment. This is noted and a footnote will be added to the text.	Section 5.4.5.3.1

Reference	Request for information	Navitas response	Addressed
DMR 65	Page 150: The Sea Lion Completion Basis of Design (SLN-CMP-WEL-BOD-00001-00) document was not provided as part of the FDP document set. When is it expected?	This BoD is an internal document and does not form part of the FDP submission. The completion design will be detailed in each PON 4 submission to FIG for approval prior to drilling commencing.	N/A
DMR 66	Page 150: CaCo3 should be CaCO3 (assuming it refers to calcium carbonate, not calcium cobaltite).	Thank you for your comment. This is noted and the text will be amended.	Section 5.4.6.1
DMR 67	Page 152: It states that "All explosives will be stored as described in Section 5.11.1.2" but section 5.11.1.2 does not describe how they will be stored (it only states "Explosives which require a bespoke and secure storage facility").	Explosives may be required in the event of stuck-pipe, to release a pipe should it get stuck down-hole. Detail will be added to Section 5.11.1.2 to describe storage.	Section 5.11.1.2
DMR 68	Page 155: It is not clear why gas needs to be flared during commissioning of the systems (generating 1,000 tonnes of CO_2 per day), as the FPSO has capacity to start building up an inventory of gas. Can it be explained why gas needs to be flared and cannot be stored?	Associated gas is liberated from the oil producing wells. There needs to be sufficient volume of gas liberated to meet with the minimum operating parameters of the gas compression system to allow for safe start up of the gas compression process. During commissioning, the initial start up of the gas compression system takes longer than normal start up as control system and instrumentation systems need to be calibrated and tuned before handing over to normal operations. Navitas will review methodology to determine the 389.2 figure (Refer to Development Description section 5.4.9) and clarify as necessary in the post-consultation EIS. Navitas has taken a conservative approach to the volume of gas we would flare at start up as we will be making modifications to the existing systems; when adding new units to existing systems, these often	Section 5.4.9

Reference	Request for information	Navitas response	Addressed
		present more difficult challenges compared to all new systems when starting up. However, a robust approach to pre-commissioning prior to sail away and keeping core competent resource from the existing crew will ensure the commissioning exercise has the best opportunity in reducing flared volumes below the current conservative volumes.	
DMR 69	Page 155: The third bullet point seems unnecessary given the content of the second one (perhaps they could be merged)?	Thank you for your comment. This is noted and the text will be amended.	Section 5.4.10
DMR 70	Page 155: It states that "Detail on the installation and operation of the X-mas tree is provided in Section 5.8.1", but section 5.8.1 on gives a very brief explanation of what an X-mas tree is, not how it is installed or operated.	Thank you for your comment. This is noted and the text will be amended.	Section 5.4.10
DMR 71	Page 156: It is not explained how and why the indicative locations of the moorings were chosen. This would be useful.	Thank you for your comment. These indicative locations were previously identified in consultation with the FIG Harbour Master as they appeared to offer sufficient sea-room for the mooring and offload of the LTVs, without hindering other Berkeley Sound users, and were not considered to be of particular environmental sensitivity. Final locations will be determined in consultation with FIG with decision criteria covering both environmental and socio-economic (other users of Berkeley Sound) considerations. This will be clarified in the post-consultation EIS.	Section 5.5.1
DMR 72	Page : It is not clear why the sentence "Detail on the installation process, quantities and / or dimensions of each bit of infrastructure are provided Table 5.12 below." is included as this section is not about infrastructure.	Thank you for your comment. This is noted and the text will be amended.	Section 5.5.1

Reference	Request for information	Navitas response	Addressed
DMR 73	Page 158: The second paragraph in this section says that "Additional clump weights and tethers may also be required". The third paragraph then starts "However, in addition to the above, temporary deposits such as clump weights and tethers may also be required."	Thank you for your comment. This is noted and the text will be amended.	Section 5.5.3.3
DMR 74	Page 158: The final paragraph references table 5.13, but it should be 5.12.	Thank you for your comment. This is noted and the text will be amended.	Section 5.5.3.3
DMR 75	Page 159: The first paragraph incorrectly references table 1.13 (it should be 5.13), but mention is not needed as the table is referenced earlier in the same sentence.	Thank you for your comment. This is noted and the text will be amended.	Section 5.5.3.3
DMR 76	Page 164: Figure 5-6 is very low quality and the text is illegible in places	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	Figure 5-6
DMR 77	Page 165: Figure 5-7 is very low quality and the text is illegible in places	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	Figure 5-7
DMR 78	Page 168: The paragraph references "Table x" – presumably supposed to be figure 5-8?	Thank you for your comment. This is noted and the text will be amended.	Section 5.8.2.2.1
DMR 79	Page 169: What is the "2C" referenced in figure 5-8?	2C refers to the contingent resources versus proven resources and shows the mid-case, best technical estimate. It is similar to the P50 estimate but is not quite synonymous. For the sake of clarity, the EIS will be updated to show the P10-P50-P90 production profiles (the P50 estimate being almost identical to the 2C case).	Section 5.8.2.2.1 Figure 5-8

Reference	Request for information	Navitas response	Addressed
DMR 80	Page 169: Is the consumption of 5mmscfd of fuel gas per day per GTG or for all three? (this is specified for diesel)	The estimated fuel gas usage includes all GTGs and is for all three turbines. Of note, mmscfd = million standard cubic feet per day. Navitas will ensure this is clear in the post-consultation EIS.	Table 5.15
DMR 81	Page 170: R134a does not have a low GWP and as a result a 2006 EU Directive recommended its phase out, which started in 2010. The United States has also started phasing it out. R-1234yf or similar products are ones with a genuinely low GWP.	Thank you for your comment. This is noted and agreed. The example of R134a will be removed. Although the commitment to use low GWP F-gases remains.	Section 5.8.3.2
DMR 82	Page 171: Reference is made to table 17 – it is assumed this is meant to be 5.16? It also references “Table 10.9” but this potentially should be “Section 10.9”.	Thank you for your comment. This is noted and the text will be amended.	Section 5.8.3.3
DMR 83	Page 172: The final paragraph references section 3.2, but it is not clear why (as section 3.2 is not about detailed design).	Thank you for your comment. This is noted and the text will be amended.	Section 5.8.3.4.2
DMR 84	Page 174: There is another reference to section 3.2, but it is not clear why (as section 3.2 is not about detailed design).	Thank you for your comment. This is noted. The reference to Section 3.2 is that the OMS describes the project development process. However the reference will be removed.	Section 5.8.3.5
DMR 85	Page 180: Figure 5-9 is very low quality and the text illegible in places	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	Figure 5-9
DMR 86	Page 182: If there was a significant reduction in injectivity, would consideration be given to drilling more WI wells?	Thank you for your comment. Yes, this would be considered but only after the root cause of decline has been identified and alternative remediation methods have been attempted.	N/A
DMR 87	Page 183: It is stated that it will not be necessary to heat the injected water after the first year. Is the temperature spec in table 5.20 only for the first year? If so, perhaps that could be made clear in the table.	Thank you for your comment. This is noted and Table 5.20 will be edited to make it clear that heated WI is only for the first year.	Section 5.8.5.8 Table 5.20

Reference	Request for information	Navitas response	Addressed
		Heated water injection will be required for the initial period of production lasting 12 months. Further details and assumptions are also provided in Section 10.9.4.4.1 and Table 10.63.	
DMR 88	Page 184: Under what circumstances would produced water be deemed unsuitable for reinjection?	Thank you for your comment. Produced water compatibility tests have been performed to demonstrate that it can be reinjected into reservoir and process equipment has been designed to ensure the water meets the standards to be reinjected. The provision for overboarding of treated produced water would be a short term contingency provision for unforeseeable circumstances. A note will be added to the post-consultation EIS to ensure this is clear.	Section 5.9.1.1
DMR 89	Page 190: The FPSO/MODU will also presumably not use the TDF? Will all other vessels listed in table 5.24 except CTTs and LTVs use the TDF? The start date given for upgrading the causeway (Q2 2024) appears to be out of date. The second paragraph references “H1 2024” – is this meant to be Q1, and if so, is it still correct?	Thank you for your comment. Neither the FPSO nor the MODU will use the TDF, indeed neither will visit any location in the Falkland Islands and will remain at the Sea Lion field only. The CTTs will not use the TDF either. They will call into the Sea Lion field accept their cargo from the FPSO then continue on their international voyage. The LTVs will only use Berkeley Sound (and will not call into the TDF). It is also highly unlikely that the OCVs will use the TDF (due to draft). The vessels which will use the TDF are the OSVs and ad hoc freighters (i.e., the supporting vessels, all with a draft less than 7m). These vessels will all use the TDF in line with the project description. With regards to the timing of the TDF Causeway upgrade the correction is noted. It is expected,	Section 5.11.1.1.1

Reference	Request for information	Navitas response	Addressed
		subject to project sanction and planning approval, that the causeway upgrade will commence in 2025. The contractor has been selected and budget allocated.	
DMR 90	Page 192: The top two rows (supply base and mud plant) state the duration of requirement as five years. However, the two drilling campaigns start in year 2 and end in year 9 – is five years correct?	Thank you for your comment. The text will be clarified. The mud plant will only be in active use for ~5 years during the Phase 1 and Phase 2 development drilling campaigns. However, due to the scheduling of the programme, it will be in place a short time prior to the commencement of Phase 1 during the break between Phase 1 and Phase 2 and throughout Phase 2. If no further drilling activity is planned after Phase 2 it shall be dismantled. So, in answer to the question, the mud plant (LMP) will be in situ for up to 9 years but only active for ~5. With regards to the supply base, this is similar. The supply base will increase and decrease in size and activity levels throughout the stages of the development programme. It will be at its busiest and largest during SIMOPs and smallest and least active during steady state operations. The supply base will remain throughout the lifecycle of the Sea Lion Field.	Section 5.11.1.2
DMR 91	Page 193: The new incinerator is expected to be ready for operation in Q1 2026 – is this “well in advance of the Seal Lion development campaign”?	Thank you for your comment. At the time of writing the EIS, the incinerator was expected in 2024. Latest estimate from PWD (provided August 2024) is end 2026. There are mitigations/contingency plans detailed in the EIS in the event that the incinerator is not ready prior to the commencement of Sea Lion operations.	N/A

Reference	Request for information	Navitas response	Addressed
DMR 92	Page 195: Final sentences references EIA rather than EIS.	**Initial consultation response:** Thank you for your comment. This is noted and the text will be amended. **Post-consultation comment:** The use of EIA is appropriate in this sentence which refers specifically to the impact and risk assessment sections.	Section 5.11.2
DMR 93	Page 199: EIA is used instead of EIS.	Thank you for your comment. This is noted and the text will be amended.	Section 5.11.3.1
DMR 94	Page 200: It is estimated that there will be 17 SAR training flights per month. However, in table 5.25 it states there will be 20 hours per month and 3 hours in each flight, which would be 6.7 flights per month. The 6.7 figure (incorrectly rounded to 6.6 here and elsewhere) is used later in the EIS in table 10.9. Would there really be more than this many training flights for the whole length of the project?	Thank you for your comment. Table 5.25 is correct. The UK CAA (in CAP 999) states in section 3.9 and 3.10, that the helicopter operator is responsible for the number of SAR training hours. Navitas' selected helicopter operator states that 20 hours per month is the expected number of SAR training hours required per month. The text will be amended to correct this in the post-consultation EIS.	Section 5.11.3.2 Table 5.25 Section 10.2.4.2.1 Table 10.9 Section 11.9.4.3.1 Table 11.45
DMR 95	Page 202: How will Navitas “encourage the private sector to increase rental housing stock to meet demand”?	Thank you for your comment. Navitas will tender for the construction of rental housing units. An expression of interest exercise has already determined that there is interest and capability in the Falklands private sector in responding to this demand and engaging in the competitive tender process. Navitas will ensure that this is clear in the post-consultation EIS.	Section 5.11.4.1
DMR 96	Page 202: The Accommodation type section only covers the hostels. Could details be given of the temporary accommodation unity and in-transit accommodation unit?	Thank you for your comment. 'Hostel-type accommodation' perhaps misrepresents the intent of this section. Elsewhere in Public Consultation Presentations and those to the Chamber of	Section 5.11.4.1

Reference	Request for information	Navitas response	Addressed
		Commerce as well as the Expression of Interest (EOI) in the Penguin News, this requirement was called a 'hotel'. Apologies for this confusion. The described hostel type/hotel accommodation will be for the transitory / offshore personnel so is synonymous with the temporary accommodation unit / in-transit accommodation unit. For longer term shore-based personnel, houses will be procured. The EOI for this requirement was issued in the Penguin News in February 2024 and should the Sea Lion development be approved, further action shall be taken on this requirement. Navitas will ensure that this is explained in the post-consultation EIS.	
DMR 97	Page 205: The assume Stanley Potable water supply limit (82m³/day) is confusing the readers at this point in the document as it is not explained that this is the unused supply capacity until chapter 11. It would also be helpful if existing demand could be explained here so the impact of the additional demand can be put in context.	Thank you for your comment. This is noted and details will be added.	Section 5.11.4.2
DMR 98	Page 206: The waste treatment facility is not yet under construction.	Thank you for your comment. This is noted and the text will be amended.	Section 5.11.4.2.4
DMR 99	Page 207: The average water usage figure for personnel and accommodation in table 5.27 (70m³/day) equates to 233 people at 300 litre per person per day. This is far higher than the maximum number of people expected to be onshore at any given time in table 5.26 (26 permanently onshore, 74 temporarily onshore and 62 in transit). The same comment applies to table 11.23 on page 989.	Yes, this includes offshore personnel as well (to account for a worst-case in the event of a 'down man'). Otherwise, water will be mostly made up offshore by watermakers on the MODU/FPSO for personnel use. A note will be added to the table to clarify.	Table 5.27
DMR 100	Page 209: “Waste Management Strategy” – should this be “Waste Management Plan” in line with language elsewhere (assuming it is the same thing).	Thank you for your comment. At the current time, Navitas has developed a Waste Management Procedure which has been submitted to FIG for review. This procedure will be used to develop	Section 3.2.18

Reference	Request for information	Navitas response	Addressed
		project-specific Waste Management Plans which will be tailored to each operation in line with the current infrastructure on Island and in line with relevant FIG / UK legislation. Navitas accept the comment and will update the EIS (Section 3.2.18 and Chapter 10.11) to ensure consistency of language.	
DMR 101	Page 213: The legislation referenced should be the Offshore Minerals Ordinance 1994 rather than the Offshore Minerals Ordinance (Amendment) (2011).	Thank you for your comment. This is noted and the text will be amended.	Section 5.15
DMR 102a	Page 230: Section 3.2 does not appear to refer the extent of liability in relation to CTTs.	Thank you for your comment. Navitas OMS Elements 5 (Operations Management) and 6 (Production Management) are relevant to offtake operations between the FPSO and the Conventional Trading Tanker (CTT). Furthermore, EIS 5.10 provides detail on the Navitas Assurance Process for purchasers' tankers and indicates that a dedicated berthing crew will board the CTTs for each offtake to ensure competency and consistency of the operation, aligned with Navitas' agreed offtake operating procedures. The Conventional Trading Tanker itself is not under Navitas direct control or liability, and the field operator will not have title or liability for the crude transferred once it is discharged from the offloading flange on the FPSO. In the event of an incident involving the CTT, the liability would sit with the crude offtaker/tanker owner and would be covered by the tanker P & I Club Cover, and insurance under CLC 1992.	Section 3.2.6

The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	All Figures checked for resolution and improved where possible
DMR 127	Page 324: The first confirmed vessel landing in the Falklands occurred in 1690 (17th century)	Thank you for your comment. This is noted and the text will be amended.	Section 7.4.3.3.5
DMR 128	Page 328: The first section of table 7.8 is on NFB and the Sea Lion Field, but the cell containing the summary of the offshore benthic flora and fauna row is about Berkeley Sound (it is an exact copy of the summary of the Berkeley Sound Deeper water flora and fauna four rows below).	Thank you for your comment. This is noted and will be corrected.	Table 7.8
DMR 129	Page 335: It is stated that southern rock cod Is currently the most abundant finfish on the Falkland Islands shelf. However, this is outdated and the most abundant finfish is now the common hake.	Hake is the most important catch however rock cod remains abundant, just not targeted. See ZDLT1-2023-02 for example the abundance of rock cod within this ground fish survey is number 2 and falls slightly behind the most abundant hoki, text will be amended.	Section 7.4.4.2.3.2
DMR 130	Page 339: “Within the kelp *P. cornucola* inhabit the benthos particularly in algal litter” doesn’t seem to make sense.	Thank you. Navitas thinks it does make sense but will amend to make clear. Note algal litter is found on the benthos in areas of low energy.	Section 7.4.4.3.1.1
DMR 131	Page 347: Note three on table 7.12 states “The species names relating to the species codes are found in Section 7.4.5.2.3”, but they are not given in that section. It would make this table easier to read if species names could be written out (accepting this would need a reduction in font size).	Thank you for your comment. This is noted and the Section reference will be amended.	Table 7.12

Reference	Request for information	Navitas response	Addressed
DMR 132	Page 348: Section 1.4.5.3.1.3 and table 1.13 are referenced but do not exist.	Thank you for your comment. This is noted and the text will be amended.	Removed
DMR 133	Page 352: It would be useful context to add the Sea Lion location to the maps in figure 7-48.	**Initial consultation response:** Thank you for your comment. This is noted and will be added. **Post-consultation comment:** The figure was examined and it was found that the track marks would be obscured if the Sea Lion location was added with a marker. Therefore, the figure remains the same as the public consultation version of the document. **Update:** Sea Lion location added to Figure	Figure 7-48
DMR 134	Page 353: There seems to be a numbering/formatting error in the paragraph beneath the one on GPS tags.	Thank you for your comment. This is noted and will be amended.	Section 7.4.5.2.1.4
DMR 135	Page : In the penultimate paragraph it mentions figures 7-49, 7-50 and 7-51 show animal tracking. It should be 7-50, 7-51 and 7-52.	Thank you for your comment. This is noted and will be corrected.	Section 7.4.5.2.1.4
DMR 136	Page 354: It is stated that “rockhopper penguins, which foraged beyond the Patagonian Shelf and slope during incubation, in water > 600 m deep”. Is this correct, as figure 7-50 suggests that it is during the chick-rearing stage that they do most foraging in the deep water (the incubation period map only has a very small number of trips into deep water)?	Thank you for your comment. This is noted and the text will be corrected.	Section 7.4.5.2.1.4
DMR 137	Page 359: The label of the map in the upper right of figure 7-52 should read “Elephant seal” rather than “Elephant sea”	Thank you for your comment. This is noted and will be corrected.	Figure 7-52
DMR 138	Page 362: The section on white chinned petrels states they are in decline twice in one sentence.	The typo will be corrected.	Section 7.4.5.2.2
DMR 139	Page 371: Footnote 2 has been improperly formatted in the header row to appear the same size as normal text.	Thank you for your comment. This is noted and will be corrected.	Table 7.17 Table 7.23
DMR 140	Pages 378-379: Figures 7-60 and 7-61 are low quality and some text barely legible	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be	All Figures checked for resolution and

Reference	Request for information	Navitas response	Addressed
		checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	improved where possible
DMR 141	Page 382: Note three on table 7.19 states "The species names relating to the species codes are found in Section 7.4.5.2.3", but they are not given in that section. It would make this table easier to read if species names could be written out (accepting this would need a reduction in font size).	Thank you for your comment. This is noted and the correct section will be referenced.	Table 7.19
DMR 142	Page 383: Regarding the statement "There is some evidence that food availability has been poor in the 2015/16 season", could this be cross referenced with fishing catch data for that year?	The statement about food availability relates to the cited FISMP report (Crofts and Stanworth, 2017), and the observed low breeding success and starvation in moulting adult penguins. There are no studies that link fishery catch to low breeding success and starvation in penguins. Fishery catch is not necessarily a useful or relevant index of penguin food availability.	N/A
DMR 143	Page 384: Table 7.20 shows an increase in the number of Gentoo pairs at Cow Bay between 2010 and 2022, but the final column states there is decrease since 2010. Similarly, there was a large decrease in the number of Gentoo pairs at Volunteer Point but the final column states the population was steady since 2010. The footnote is confusing as the column header states "since 2010" whereas the footnote suggests the trend is since 2015. The trend for Rockhoppers at Diamond Cove suggests a stable population despite a 35% decrease in pairs since 2010, while the trend for Kings is steady despite a 31% increase in the number of chicks.	The EIS Table 7.20 is correct. The table shows the long-term trend (1995-2022) and short term trend (2010-2022). The 2010 versus 2022 counts, may appear to contradict the population trend in the table (stable, increase or decline). However, comparing two years (e.g., 2010 versus 2022), is not the same as a trend over time (e.g., 12 years between 2010 and 2022). Navitas will update the Table footnote text to avoid confusion over time period.	Table 7.20
DMR 144	Page 388: It is stated that the Imperial Shag is "by far the most abundant species recorded during the winter months" but its winter population is much smaller than several other species It was by far the most abundant species in summer – is this what it should have said? The meaning of the sentence "So although imperial shags were not observed on the coast in the winter, they are still abundant within inshore waters during the winter months" is also unclear.	Thank you for your comment. This is noted and the text will be updated to clarify summer and winter abundance of shags.	Section 7.4.5.3.2

Reference	Request for information	Navitas response	Addressed
DMR 145	Page 396: Table 7.23 gives the Falkland population of Sooty shearwaters as 100,000 pairs, 0.5% of the global population; elsewhere in the document the figure is given as 139,000 / 0.1%	Thank you for your comment. This is noted and the text will be checked for consistency and corrected where relevant.	Table 7.23
DMR 146	Page 399: Table 7.23 states that the global population of tussac birds is unknown but the report also states that they are endemic to the Falklands – would this not mean that the global population is the same as the Falklands population (c. 15,000-28,000 pairs)?	Thank you for your comment. This is noted and the text will be corrected.	Table 7.23
DMR 147	Page 400: There is a footnote 3, but no use of it in table 7.23.	Thank you for your comment. This is noted and will be corrected.	Table 7.23
DMR 148	Page 401: Are the Poncet surveys still ongoing?	Yes, these are annual surveys.	N/A
DMR 149	Page 404: The figure of 291 mortalities in 2022 does not seem to align with table 7.25.	Thank you for your comment. This is noted and will be corrected.	Section 7.4.5.5.1
DMR 150	Page 405: The figures in table 7.25 do not seem to align with the text in page 404, which states that it is assumed there is one mortality for every three heavy contacts; in the first row the number of mortalities is 20 times higher than the number of contacts, whilst for Loligo, the number of extrapolated mortalities is three times the actual. If the numbers in the table are correct, can the discrepancy/workings be explained?	Having re-checked the 2019, 2020, and 2022 Bulletins (seabird mortalities were not reported in 2021), the number the commenter is referring to seems to the 291 mortalities in 2022, vs 875 mortalities for 2022 in the table. 875 is correct, and the text will be amended for clarity. The error came from exploration of the 2022 data where heavy contacts were not reported explicitly, and so when exploring the basis for extrapolated numbers, 875/3 = 291, which was mistakenly used in the text.	Section 7.4.5.5 Table 7.25
DMR 151	Page 406: The final sentence states that “Table 7.26 shows the species listed under ACAP that occur within Berkeley Sound waters” (eight species) but the table is actually about the Falkland Islands in general rather than Berkeley Sound (it lists 12 species and includes the BBA as a ‘common breeder’ despite it not breeding in Berkeley Sound).	Thank you for your comment. This is noted and will be amended.	Section 7.4.5.5.2
DMR 152	Pages 409-412: Figures 7-73 to 7-76 are low quality and some text barely legible	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be	All Figures checked for resolution and

Reference	Request for information	Navitas response	Addressed
		checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	improved where possible
DMR 153	Page 421: The final paragraph of the section ends with an incomplete sentence: “During this period an increased but small number of…”	Thank you for your comment. This is noted and will be corrected.	Section 7.4.6.2.1.2
DMR 154	Page 421: How do observations mitigate the impacts of seismic surveys?	MMOs keep watch for any marine mammals in the area. If any marine mammals are seen, the surveys are not allowed to take place, as per the JNCC Guidelines. Of note, no seismic surveys are planned.	N/A
DMR 155	Page : In the sentence “The concurrent survey within Licence Block PL001 was conducted other a period of 109 days”, presumably “other” should be “over”	Thank you for your comment. This is noted and will be corrected.	Section 7.4.6.2.1.3
DMR 156	Pages 422-427: Is there a reason there are distribution maps for some species (e.g., Peale’s dolphin) but not others (e.g., killer whales)?	Killer whales were very rarely observed and therefore distribution maps were not possible.	N/A
DMR 157	Page 423: Does the statement that “Acoustic detection of sei whales is further hampered by the absence of sei whale call descriptions for the South Atlantic” take into account the recent research by Caroline Weir?	This has been looked at by Cerchi and Weir (2022). It would seem that juvenile leopard seal calls and sei whale vocalisations may be similar but Cerchi and Weir (2022) consider that they are sei whales. However the conclusions are not categoric and will require further research. Navitas will reference the recent research in the post-consultation EIS.	Section 7.4.6
DMR 158	Page 429: It would be useful if the key of figure 7-88 included an explanation of the difference between maps A and B. The key’s wording is also a little odd saying “South American fur seal, predicted habitat use (predicted presence) breeding on the Falklands” instead of “Predicted habitat use (predicted presence) of South American fur seals breeding on the Falklands”. There is also a repetition of text in the key, with “(2019). The pink dot represents the drill centre” appearing twice.	Thank you for your comment. This is noted and the text will be clarified.	Figure 7-88

Reference	Request for information	Navitas response	Addressed
DMR 159	Page 430: The key for figure 7-89 has the same wording issue as 7-88 (saying "Southern elephant seal, predicted habitat use (predicted presence) breeding on the Falklands").	Thank you for your comment. This is noted and the text will be clarified.	Figure 7-89
DMR 160	Page 430: It is stated that table 7.28 "provides a summary of marine mammal abundance in the NFB, distribution, life-cycle and behavioural characteristics" but it only lists cetaceans and does not include pinnipeds. Was there supposed to be one including pinnipeds?	**Initial consultation response:** Thank you for your comment. This is noted and pinniped data will be included. **Post-consultation comment:** Upon further review, Navitas recognise that Table 7.28 was never intended to include seals and sea lions which are difficult to spot at sea and are unlikely to be consistently prevalent over 200km offshore. Therefore the table legend was considered to be in error and has been amended.	Table 7.28
DMR 161	Page 434: It is mentioned that there was an influx of southern right whales in 2017 and then states that "Whether this is simply an unusual year or the start of a long-term trend is yet to be determined" As there have been six winters since then, is data not available to determine this trend? The same comment is applicable to the southern right whale part of section 7.4.6.3.1.6 on page 449.	Thank you for your comment. This is noted and the text will be updated.	Section 7.4.6.3.1.1
DMR 162	Page 443: Figure 7-95 is not referenced in the text.	Thank you for your comment. This is noted and the reference will be added.	Section 7.4.6.3.1.3 (now Figure 7-94)
DMR 163	Page 444: It would be useful to mention how the number of sightings was translated into the estimated population given in table 7.31, particularly as the numbers of sightings and population do not appear to be proportional.	There is a ratio between sightings, dive (submergence times) and population estimate. The ratio is different for each species. The text will be amended for clarity.	Table 7.30
DMR 164	Page 447: In the genetic diversity section, the first two bullet points appear to be contradictory, saying there were highly significant differences in the first point and saying there was no evidence of population differentiation in the second.	Thank you for your comment. This is noted and will be clarified in the text.	Section 7.4.6.3.1.4

Reference	Request for information	Navitas response	Addressed
DMR 165	Page 457: There is also a sea lion haul-out site on Cochon Island.	Thank you for your comment. This is noted and will be added.	Table 7.32
DMR 166	Page 461: The section references “priority conservation habitats (Section 7.5.2.4)”, but the section in question is titled “Threatened terrestrial Habitats”. Similarly, it references “three priority conservation species” but the section referenced (Section 7.5.3) is titled “Threatened species”.	Thank you for your comment. This is noted and will be corrected.	Section 7.5
DMR 167	Page 463: Mallard ducks should be listed in the first bullet point as they also have no protection. Arguably the birds in the second bullet point are protected, albeit only for part of the year.	Mallard ducks are not listed, because they are infrequently sighted. For example, Woods and Woods (1997) report one Mallard duck at Goose Green in 1994. They were not reported by White *et al.* (2002), nor during extensive coastline monitoring surveys around Stanley Harbour and Cape Pembroke (Poncet, 2021). Regarding the second bullet, the text will be amended for clarity.	Section 7.5.1.3
DMR 168	Page 467: It is stated that NNRs are established under 1999 regulations but table 7.34 lists several that were established in the 1960s or 1970s.	Navitas understand that the NNRs established prior to 1999 were retrospectively included in the 1999 ordinance. See Conservation of Wildlife and Nature Ordinance 1999, 13(2).	N/A
DMR 169	Page 478: The low resolution of image 7-111 makes the key hard to read (is red high, purple medium?).	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	All Figures checked for resolution and improved where possible
DMR 170	Page 481: Some of the colours used for the key are too similar and hard to distinguish on the map. It might be helpful to add labels to the sections of each colour to allow readers to identify them.	Navitas notes DMR's comments and will review the post-consultation EIS to ensure that the colours can be clearly distinguished and/or labels are added.	Section 7.6.3 Figure 7-113
DMR 171	Page 482: Stanley is now a city rather than a town.	Thank you for your comment. This is noted and the text will be amended.	Section 7.7.2.2

Reference	Request for information	Navitas response	Addressed
DMR 172	Page 485: The statement "Patagonian rock cod has increased in importance over recent years" is not correct anymore – it hasn't been important for the last eight years after the huge drop in catches between 2015 and 2016. The timeline of the statement "experiencing 20-30 fold increase in catches" needs adding for it to make sense in the context of table 7.41, which only shows data since 2013. The statement that it "represented only 5.2 % of the catch in 2022" is incorrect. It was only 0.5% of the catch in 2022.	Text will be amended to: ''Patagonian rock cod has previously been an important commercial species but has decreased in importance since the drop in catches in 2015-16. From 2016 the catches of this species have decreased significantly and represented only 5.2 % of the reported catch between 2013 and 2022.'	Section 7.7.3.1.1
DMR 173	Page 487: The third paragraph is a repeat of text midway through the second paragraph.	Thank you for your comment. This is noted and paragraph 3 will be removed.	Section 7.7.3.1.1.1
DMR 174	Page 488: This section is about fisheries operating in the approaches to Berkeley Sound but the third sentence refers to a map of the sea lion field (Figure 7-115). Presumably this sentence should have been in the section above (Section 7.7.3.1.1.1) or figure 7-115 should be a map of the loligo fishery squares around Berkeley Sound.	Thank you for your comment. This is noted and the text will be amended.	Section 7.7.3.2.1.1
DMR 175	Page 491: It is not clear what the purpose of the sentence "A summary of all vessel use in Berkeley Sound is provided in Section 7.7.3.2.5" is.	This is to refer the reader to an overview of the vessel usage in Berkeley Sound, which is presented in section 7.7.3.2.5., this highlights the seasonal nature of the cruise ship season, which is mentioned above.	N/A
DMR 176	Page 491: It is stated that "the summary of all vessel use in Berkeley Sound (Section 7.7.3.2.5) shows that there is very limited use of Berkeley Sound by military vessels", but section 7.7.3.2.5 does not break vessels down by type.	Thank you for your comment. This is noted and the reference will be removed.	Section 7.7.3.2.3
DMR 177	Page 491: The "(see Section 7.7.3.2.5)" is irrelevant as the section in question does not break vessels down by type.	Thank you for your comment. This is noted and the reference will be removed.	Section 7.7.3.2.3
DMR 178	Page 494: Regarding table 7.44, presumably the huge decrease in vessels in Stanley Harbour in 2022 (compared to 2018) is due to COVID, but this is not stated anywhere in the section to give context (it is in section 11.2.4.2.1.1). 2023 data may be more useful if available. The same applies to table 7.45 (page 496) and every sub-section of 7.7.4.1.4 on pages 495-497.	Thank you for your comment. This is noted and detail will be added to Tables 7.44 and 7.45, and section 7.7.4.1.4 to this effect.	Section 7.7.4 Table 7.44 Table 7.45

Reference	Request for information	Navitas response	Addressed
DMR 179	Page 495: The text states that "2015 fishing vessel data is presented" but table 7.45 has figures for 2014/2018/2022.	This should refer to Figure 7-117, which shows the higher number of vessels withing Berkeley Sound during the 2014-15 season. This will be amended.	Section 7.7.4.1.4.1
DMR 180	Pages 494-496: Tables 7.44 and 7.45 do not appear to be consistent. For example, table 7.44 show 0 tankers entering Stanley Harbour in 2022 but table 7.45 states that 13 tankers docked at FIPASS in 2022. Similarly, 7.44 shows 1 cargo ship visit to the Harbour in 2022 but 7.45 states there were 25 vessel visits to FIPASS.	This data was provided by FIMA. They confirm that the vessel's destination is recorded (i.e., if it is anchoring in Stanley Harbour, it is recorded as Stanley Harbour but if it is just transiting the harbour to get to FIPASS, its location is recorded as FIPASS). So the tankers recorded at FIPASS will have transited Stanley Harbour and Port William to reach FIPASS but as this is a relatively short transition it is not recorded by the Harbour Authority. This will be footnoted in the text for clarity.	Section 7.7.4 Table 7.44 Table 7.45
DMR 181	Page 497: It is not clear why table 7.44 is referenced.	Thank you for your comment. This is noted and the reference will be removed.	Sections 7.7.4.1.4.5 & 7.7.4.1.4.9
DMR 182	Page 497: All of the main road between Stanley and MPC is now asphalted.	Thank you for your comment. This is noted and the text will be amended.	Section 7.7.4.2
DMR 183	Page 499: The reference to figure 7-113 should presumably be to figure 7-120 instead?	Thank you for your comment. This is noted and the text will be amended.	Section 7.7.4.2.1
DMR 184	Page 507: Presumably the lower-than-expected fall-back and general increase in electricity usage is linked to the increased number of homes/other buildings?	This would be a fair assumption yes.	N/A
DMR 185	Page 508: The footnote references in the table header are the same size font as the header, which could be confusing. Is there a reason the table does not include 2022/23 figures (which are given in the text on page 506)? The first cell of the final row states that 2012/13 s the base year, but the third cell states that 2013/14 is.	Thank you for your comment. This is noted and the footnote references and base year references will be amended. The 2022-23 figures were missed in Table 7.49 in error, these will be added.	Section 7.7.4.5.5.1 Table 7.49
DMR 186	Page 511: Agriculture is the third largest employment sector according to the 2021 census.	At the time of writing, census data tables and specific data requests were kindly provided by FIG Policy,	Section 7.7.4.7

Reference	Request for information	Navitas response	Addressed
		Economy and Corporate Services prior to the census being issued. These showed Agriculture as the fifth biggest employer in the islands. It is understood that a lot of work was put into accounting for those not present on census night to reflect the FI's stats more accurately - could this account for the change from fifth to third? However, as this is not what was reflected in the 2021 census once published, the EIS will be amended to reflect the published census figures.	
DMR 187	Page 519: Were there any vessels in Berkeley Sound at the time of the sound recording? It would be useful to state this for context as to whether the 'background' noise level includes vessels.	It was not recorded whether there were any vessels in Berkeley Sound during the baseline noise recordings, this will be checked against the FIMA data to see whether there would have been any vessels in Berkeley Sound at the time, and this will be noted in the document.	Section 7.7.5.2.1
DMR 188	Pages 525-527: The dark blue table headings with black text are hard to read and would benefit from the text colour being changed to white.	These will changed to white in the post-consultation EIS.	Section 7.8 Table 7.57 Table 7.58 Table 7.59
DMR 189	Page 525: The key for table 7.57 does not match the colours used in the rest of the table. Two cetacean species are listed as endangered (not one); sei whales and blue whales	Thank you for your comment. This is noted and the text will be amended.	Section 7.8.1 Table 7.57 Table 7.58 Table 7.59
DMR 190	Page 527: "Patagonian long-finned squid" should be "Patagonian rock cod"	The text will be revised in the post-consultation EIS.	Table 7.59
DMR 191	Page 530: Is a bird strike due to light outwith Navitas' control if is due to the presence of lights (as lights are within control to some extent)?	Navitas recognise that the use of light is a planned activity and that this will definitely have the impact of attracting birds. It is also recognised that the 'planned' *vs.* 'unplanned' usually refers to the activity rather than the impact itself. However, after	N/A

Reference	Request for information	Navitas response	Addressed
		considerable internal discussion and debate, the decision to consider bird strike a risk rather than an impact was taken so that the likelihood of occurrence could be factored into this particular impact. Within the risk assessment, the impact and the risk largely came out the same, with the exception of small scale strikes in Berkeley Sound. Here the impact was considered Low but given that the 'likelihood of occurrence' was 'Likely', the overall risk was considered to be Moderate and was therefore considered significant ensuring it would be flagged for monitoring and an EMMP action. Navitas does not consider the FPSO to be excessively illuminated over and above minimum safety requirements. Navitas has also committed to constraining the outward facing lighting. See also response to RSPB 8 - e and f.	
DMR 192	Page 535: The hyperlink in note 8 does not work.	Noted. Navitas apologise that this link no longer works and while revisiting the soil/seabed sensitivity Navitas has also now included reference to the IEMA 2022 guidance to ensure it is up to date with current thinking. The footnote will be amended to: Adapted from: Link and IEMA (2022).	Table 8.1
DMR 193	Page 539: Elsewhere in the document the field life is stated to be 30 years rather than the 23 stated several times in table 8.2.	Thank you for your comment. This is noted and the text will be amended.	Section 8.5.2.2 Table 8.2
DMR 194	Page 540: It looks like there is meant to be a footnote against the UK EA screen out threshold but there is not one visible.	Thank you for your comment. This is noted and the link will be changed to:	Section 8.5.2.2 Table 8.2

Reference	Request for information	Navitas response	Addressed
		https://www.gov.uk/guidance/air-emissions-risk-assessment-for-your-environmental-permit.	
DMR 195	Page 553: For the risk of introducing non-native species, one offsetting proposal could be the development of an eradication programme, subject to viability.	Noted, thank you for the suggestion. EIS Section 8.11.2.2 discusses Indirect Offsetting. Pest and invasive species eradication/control is listed as one of the potential indirect offsetting initiatives. Navitas will update table 8.9 in the post-consultation EIS to clarify that where direct offsets have not been identified, indirect offsetting will be undertaken.	Table 8.9
DMR 196	Page 554: DMR's view is that an internal Navitas fund is not appropriate. DMR would like Navitas to commit to an offsetting studies budget that would be managed by a panel consisting of FIG representatives, Navitas and appropriate Falkland Island stakeholders that would decide which studies to progress, and would also like a clear commitment on the amount of funding provided for studies per annum starting immediately after FDP approval. DMR would also like Navitas to clarify what it considers to be a "meaningful" level of scope 1 and 2 carbon offsetting and commit, and to commit to start putting money into a carbon and biodiversity offsetting projects fund from First-Oil.	Perhaps the use of the word 'Internal' has been misconstrued - the Fund will be funded internally, but the intent is that the oversight and governance will have FIG and Independent NGO representation as well as independent technical/environmental advisors. Navitas has prepared and submitted a briefing paper to FIG that outlines the intent of the fund. Navitas believe that this aligns with the FIG DMR sentiments in this comment and FIG policy and legislative requirements. Footnotes added to 8.11.1 and 8.11.4	Sections 8.11.1 & 8.11.4
DMR 197	Pages 561-585: Questions regarding the impacts identified in table 9.1: • How does placement of objects on the seabed and large dropped objects (p561) impact the human population? • Why do large dropped objects (p561) not impact the sea bed and soil? • Why does the discharge of chemicals during drilling (p562) impact fish but not marine mammals? • Why was plankton deemed to be impacted by noise from explosives but not benthos (p562)? • Why do the operational discharges listed on page 563 and 564 that	Thank you for your comment. This is noted and Navitas will check Table 9.1, 9.2 and 9.3 and update where appropriate.	Table 9.1 Table 9.2 Table 9.3

Reference	Request for information	Navitas response	Addressed
	impact fish not affect benthos or marine mammals? • Why does the discharge of fluid during valve actuation (p564) impact benthos but not other sea life? • Why does the discharge of hot water (p565) impact plankton but not other life, while subsea heat generation (p566) affects benthos and fish? • Why is underwater noise (p566) not deemed to impact benthos (as on page 663 it is stated that mussels are affected by noise)? • Why does the pilot light flare (p567) not impact sea birds (when other forms of flaring do)? On p596 it is stated that seabirds are impacted by flares. • Why does discharge of liquid waste streams to the sea impact fish and birds but not marine mammals? Applies to both pages 567 and 576 • Why does loss of containment of solid waste or liquid offshore not impact all marine life (solid waste is listed as only impacting birds and mammals while liquid waste only impacts plankton and fish)? Applies to both pages 568 and 576 • Would a topside release of reservoir hydrocarbon (p571) not also potentially impact commercial fisheries? • Why does a build-up of oil in the top of the PW discharge caisson (p573) impact fish and birds but not marine mammals? • Why do the oil spills due to collisions during offtake or hose rupture (p573) not impact the seascape? • Could the introduction of marine invasive species to Berkeley Sound (p577) impact commercial fisheries if it interferes with loligo reproduction? • Would “Presence of additional personnel on Falkland Islands” (p579) not impact the human population?		
DMR 198	Page 570: The FPSO exclusion zone is 1,250m not 500m	Thank you for your comment. As described in Section 5.5.4 the FPSO will have an exclusion zone of 1,275m. This will be checked and updated throughout the document to check for typos.	Section 9.2

Reference	Request for information	Navitas response	Addressed
DMR 199	Page 591: The text twice makes reference to three LTVs – elsewhere in the document the number of LTVs is given as four	It is expected no more than four LTVs will be utilised to support the project, with a maximum of two LTVs present, anchored in Berkeley Sound, at any one time. All sections will be checked for consistency.	Section 5.5.1
DMR 200	Pages 592-593: The colour of the light is also an influencing factor (as stated on page 610). As this is a known mitigation measure, why is this not considered in 10.1.7?	As indicated in Section 10.1.10.1 and 15.7.2.1, the practicalities of adopting the OSPAR green lighting strategy will be investigated during the project engineering phases as a potential mitigation against bird-strike. As yet green-lighting has not yet been adopted as a definite project-specific mitigation as the investigation is still ongoing.	N/A
DMR 201	Page 601: Part of the key for table 10.4 is not legible due to the lack of contrast between black text and very dark blue cell colouring.	Moderate and High text will be changed to white to ensure visibility in the post-consultation EIS.	Section 10.1.4.3.1.4 Table 10.3
DMR 202	Page 608: Reference is made to “Chapter X” – presumably meant to be chapter 15	Thank you for your comment. This is noted and the text will be amended.	Section 10.1.7.1
DMR 203	Page 611: It is stated that “The year 2007 was chosen as this represents an ‘average’ fishing year within the available data range.” However, 2007 was an unusually good year and saw the highest total catch between 2001 and 2013.	The figure will be updated where possible from the NOAA database and text added to clarify.	Section 10.1.9.2 Figure 10-5 Figure 10-6
DMR 204	Page 612: The caption of table 10.7 references the NFB but the table includes Berkeley Sound. Should fuelling vessel(s) also be included for Berkeley Sound?	The legend will be updated to include Berkeley Sound and additional vessels included.	Section 10.1.9.2 Table 10.7
DMR 205	Page 620: Does helicopter noise also affect cetaceans when they are at/near the surface?	When they are at/near the surface marine mammals may be briefly affected by helicopter overflight noise but as the helicopters fly over quickly, and at heights over 3,400 ft (apart from take-off and landing) and marine mammals are generally spending lesser amounts of time at the surface (compared to hauled	Section 10.2.3

Reference	Request for information	Navitas response	Addressed
		out seals or bird colonies), the impacts are not considered significant and it is not considered further in the assessment. The Sea Lion helicopters will follow the FILFH Guidelines.	
DMR 206	Page 626: It is stated that flights between Stanley and the CTT would be "mostly over the sea and should not pose a significant risk to wildlife aggregations onshore." However, they would presumably take a similar flight path as helicopters between Stanley and the FPSO and pass over Seal Bay and close to other very sensitive areas.	Flight paths out to the CTT would be generally similar to those going out to the FPSO but may range slightly further east or west depending on from which direction the CTT is arriving at the field. It is not possible to predict their exact routes at the moment but all flights out to the CTT (as with all Sea Lion helicopter flights around the islands) will comply with the Falkland Islands Low Flying Handbook. Text will be amended to clarify the broad routes, i.e., that they will be similar to those going to the FPSO.	Section 10.2.4.2.4.2
DMR 207	Page 626: Was the Falkland Islands Low Flying Handbook Guidance published in 2015 or 2017? The document inconsistently refers to "FILFH, 2015" and "FILFH, 2017" in multiple places, sometimes on the same page (e.g., pages 627 and 1064).	FICAD confirm the FILFH is updated regularly, the references to this guidance will be updated throughout the EIS as 'FILFH, 2024'.	Section 10.2 Section 11.9, Section 10.3.4.3.1
DMR 208	Page 641: Figure 10-9 is very low quality and text illegible in places.	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	All Figures checked for resolution and improved where possible
DMR 209	Page 642: Why is the total for all MODU anchor placements equivalent to 20 areas being disturbed when there are ten anchor placements and ten removals. Will the placements and removals not be the same area being disturbed?	The chapter refers to 20 moves, not 20 locations (10 anchor placements and 10 anchor removal events, albeit in the same areas). The narrative will be updated to clarify.	Section 10.3.4.3.1 Table 10.14
DMR 210	Page 650: The figures given for the number of losses from mobile unit crane decks does not appear to add up. It is state that there were 0.034 losses per	The OGP Risk Assessment Data Directory Report No. 434 – 17, March 2010, has been checked and the	Section 10.3.6.2.1

Reference	Request for information	Navitas response	Addressed
	year over a 19-year period, which is equivalent to less than one loss (0.6) over the entire period, which is presumably not correct. Is the figure meant to be 0.034% (i.e., 83 losses)?	narrative has been updated from: 'With regard to the likelihood of objects being dropped, data gathered between 1980 - 1999 indicate that in a yearly average of 24,480 lifts from mobile unit crane decks, only 0.034 losses per year occurred (OGP, 2010).' TO: Over a period of 37 years (1970 - 2007), only one dropped object was recorded worldwide from units ranging from FPSO's to semi-submersibles (OGP, 2010). This amounts to a frequency of 0.027 incidents per year. According to the OGP (2010) on mechanical lifting failures, the probability of a dropped object from a mobile unit is 0.0000014 per lift. An additional reference has been included: OGP. 2010. International Association of Oil and Gas Producers: Mechanical Lifting Failures. Report No. 434 – 08 March 2010.	
DMR 211	Page 664: The sentence “However, it is likely that particle motion is equally important as sound pressure in fish (and invertebrate), perception of sound.” does not appear to make sense.	The text will be clarified in the post-consultation EIS.	Section 10.4.4.4.3.1
DMR 212	Page 672: As the number of wells, the size of FPSO and CTT arrangements has changed from the previous operator’s plans, is using their modelling of scenario 1 (installation of subsea infrastructure and drilling of wells) and 2 (steady state production) still appropriate?	These are snapshots of operations which will be very similar to those in the previous EIS but please note that underwater noise modelling is being further revised and refined with new models. Navitas does not anticipate any change to the impact assessment as the operational footprint is smaller than the	Section 10.4 Section 10.5

Reference	Request for information	Navitas response	Addressed
		previously proposed Premier development. See also FIFD 54.	
DMR 213	Pages 674-675: The data in figure 10-12 and table 10.26 does not appear to be consistent. The peak noise levels in the table do not match the ones in the figures (for example, in the figure the peak noise for the tanker is around 192dB while in the table it is around 198-201dB).	Refer to DMR 212. The figure shows generic levels for a number of vessels etc. and the table shows the specific, and conservative, levels used in the modelling. A foot note has been added to clarify and table/figure titles amended.	Section 10.4 Figure 10-12 Table 10.25
DMR 214	Page 701: It is stated that "The PK injury thresholds for each marine mammal hearing group are shown in Table 10.23". However, they are in table 10.24.	**Initial consultation response:** Thank you for your comment. This is noted and the text will be amended. **Post-consultation comment:** The revised noise risk assessment incorporates updated noise modelling. Given the absence of impulsive sound sources, the PK injury thresholds are no longer included.	N/A
DMR 215	Page 715: The Cranford *et al.,* experiment was for ten days. How long does Navitas envisage surface drilling discharges lasting during each individual drilling? If it is a significantly longer period, are there any studies that consider longer-term impacts?	Over the course of the Phase 1 drilling campaign, discharges will occur for a cumulative (but non-continuous) total of *c.* 286 hrs (11.91 days). For example, drilling a 36' top-hole would result in *c.* 8 hours of time with muds being circulated and discharged. A few days later, there will be 18 hours of circulation and discharges when drilling the 17 1/2' top-hole. Therefore discharges will occur episodically. This will be similar for the Phase 2 drilling campaign carried out a number of years later.	N/A
DMR 216	Page 737: The metocean dataset covers only three years – is this deemed sufficient to cover long-term current changes (for example the occasional stronger Falkland current that disrupts Loligo fisheries at irregular intervals)? DNR has datasets going back to the mid-1990s.	Navitas (then POEPL) acquired metocean data from various sources including modelling and measurements. These data underwent independent peer review to determine that they were sufficient.	N/A

Reference	Request for information	Navitas response	Addressed
		Specifically, the data sources included: - Dedicated wind, wave and current models from the UK Met Office and BMT Argoss to inform the design and operational criteria. In situ measurements included: - Directional wave data from wave buoy (FOSA 1997-98, Premier Oil 2014 - 16) - Current moorings (FOSA 1997-98, Rockhopper 2011-12) - Wind data from drilling rigs (Borgny Dolphin 1998, Erik Raude 2015-16) Therefore, the metocean data used for the modelling are considered sufficient. Navitas note the comment on data sets held by DNR, however, these are not suitable for the modelling that was undertaken.	
DMR 217	Page 743: It is stated that “the impacts associated with other discharges to sea e.g., drill cuttings discharges and ballast water and warm water from cooling systems are described elsewhere in this document as indicated in Table 2.2.” However, table 2.2 has no mention of ballast water or warm water from cooling systems.	Thank you for your comment. This is noted and Table 2.2 will be updated.	Table 2.2
DMR 218	Page 750: Why are benthos, cephalopods and marine mammals not considered potential receptors to operational discharges?	Thank you for your comment. This is noted and these will be specifically listed in the receptor section although the impact assessment section refers to 'marine organism' collectively to avoid repetition.	Section 10.7.3
DMR 219	Page 751: Regarding the claim that discharging water at depth aiding mixing and dispersion, are ocean currents not slower at depth, and therefore less helpful for mixing and dispersion?	Yes, surface currents can be strong compared to deeper currents due to wind, tides, etc. However, because the ocean is highly stratified, it cannot be assumed that currents are weaker with increasing	N/A

Reference	Request for information	Navitas response	Addressed
		depth, with each strata having different physical properties (i.e., density) as well as movement where deep water can move in different horizontal directions and speed compared to strata above or below. With respect to discharges, mixing and dispersion are also dependent on the difference in density (combination of temperature and salinity) of the discharged water compared to the receiving water, as well as the amount of water movement and force at which the discharged water is being expelled. The density differential will mean that discharged water will either rise or fall, which in itself will cause turbulent mixing irrespective of currents. Considering mixing due to difference in density as well as discharges being expelled into a turbulent ocean, mixing and dispersion is likely to occur very quickly in a highly localised space. This is detailed in 10.7.4.1.2.2 Behaviour and fate of PW discharges.	
DMR 220	Page 752: It would be helpful if the reason for the differences in concentrations in water phase in early and late field life set out in table 10.42 were explained.	This is related to declining oil rates and increasing water cut over time and the partitioning co-efficient of the chemicals between the oil and water phase. The narrative will be updated.	Section 10.7.4.1.2.1 Table 10.46
DMR 221	Page 758: “the necessary dilution to achieve a No Effect Concentration (NEC) would be reached at <10 to 100 m and usually less than 500 m” does not appear to make sense (it infers that it is always between <10 and 100m, but then states usually less than 500m).	The text will be amended to state: 'the No Effect Concentration (NEC) would usually be reached at <10 to 100 m and always less than 500 m'.	Section 10.7.4.2.2.1

Reference	Request for information	Navitas response	Addressed
DMR 222	Pages 768-769: The titles of figures 10-30 and 10-31 state that yellow equals 5% risk but the (barely legible) key states yellow is 1-5%. Due to the low quality of the graphics, the distance marker is also barely legible and the depth axis of the lower figures is not legible.	The 5% refers to the worst-case of the yellow range (1-5%). The figure legend will be reviewed in the post-consultation EIS to ensure clarity.	Section 10.7.4.5.2.3
DMR 223	Page : The plumes appear to go lower than the maximum depth shown in the lower graphs in the figures. Could the figures be extended so the entire depth of the plume is visible?	The green colouring denotes no significance and the important area to note is the yellow which is the area of 5% risk where risk (EIF) is counted. The rest gives a sense of the shape and structure of the plume.	N/A
DMR 224	Page 781: Would the Conservation of Wildlife and Nature Ordinance 1999 not be relevant to thermal discharges given that some discharges will be at up to 90ºC (as stated on page 782) and therefore could cause harm to wild birds (penguins) that approach the discharge outlet.	We understand the comment. We can add the ordinance to the legislation section. However, discharge into 4 degree seawater at the rate designed would mean the hot water would disperse rapidly. Furthermore, Navitas considers that, if there was a tangible temperature gradient then penguins would swim away from any warmer water.	Section 10.8.1.1
DMR 225	Page 782: There will also be some active heating of subsea infrastructure in certain circumstances (the circulation of hot oil set out in table 5.18)	This was omitted in error and will be added to the sources section in the post-consultation EIS.	Section 10.8.2
DMR 226	Page 783: Given the potentially high temperature of some discharges, would cephalopods, marine mammals and sea birds not also be potential receptors as well?	Thank you for your comment. This is noted and these will be specifically listed in the receptor section although the impact assessment section refers to 'marine organism' collectively to avoid repetition.	Section 10.8.3
DMR 227	Page 787: Why are the temperatures at the point of release shown in figure 10-35 (maximum of around 14ºC) so much lower than the temperatures of the cooling and produced water (50ºC and 90ºC) in table 10.53?	These graphs show the temperature difference from ambient seawater around the discharge, not the temperature of the discharge itself. Of note, and as stated in the figure, the high volume of CW and stable plume creates a stable temperature change near the discharge point whereas the small volume of PW is dispersed almost immediately.	Section 10.8.4.3.3.3
DMR 228	Page 796: Perhaps it should be clarified that the Falklands are one of the overseas territories that ratification was extended to.	The narrative will be amended for clarity to explain that:	Section 10.9.1.1.1

Reference	Request for information	Navitas response	Addressed
		The UNFCCC ratification has been extended to the Falklands Islands but as yet, the Paris Agreement and the need for the NDC has not yet been. In 1992, the UN Framework Convention on Climate Change (UNFCCC) was adopted. It has the objective of stabilising greenhouse gas levels in the atmosphere at a safe level. Of the Territories, Bermuda, Gibraltar, the Cayman Islands, and the Falklands have had UK ratification of the UN Framework extended to them (to 2022). No OT has had the Paris Agreement on climate change extended to them, though in the 2021 Joint Ministerial Council between the UK and the Territories, some expressed an interest: The UK warmly welcomed the ongoing interest from some Overseas Territories in being covered by the Paris Agreement, and confirmed that the UK stands ready to support these Overseas Territories. The Paris Agreement was adopted in 2015 and requires ratifying parties to submit plans for climate action, known as nationally determined contributions, with a view to limiting global warming to 2ºC. Ref: House of Commons Library .2023. International treaties and the Overseas Territories. Research Briefing. 26 January 2023. Number 9707	
DMR 229	Page 800: Should a fire on board a vessel be considered for the list of emissions from unplanned or emergency events?	Thank you for your comment. This is noted. Fires are usually dealt with as a safety matter rather than an	N/A

Reference	Request for information	Navitas response	Addressed
		environmental one. We are not aware of any precedent for including emissions from crude oil fires in an EIS.	
DMR 230	Page 811: The figures in table 10.59 and 10.60 appear to be UK only. The UK Greenhouse Gas Inventory, 1990 to 2021 (which is the UK's official annual report to the UN) includes overseas territories like the Falkland Islands – would this be a better dataset to use, especially given that section 10.9.4.3.3 starts with the statement that "Emissions in the Falkland Islands are covered by the UK and must be reported in the UK GHG inventory."	The data used in Tables 10.59 and 10.60 use raw data from the Final UK greenhouse gas emissions national statistics 1990-2021 (DESNZ, 2023b). In error, data from Table 1.1 were used which include only the UK emissions and did not include the emissions listed in Table 3.1. The data will be updated to include all emissions from Overseas Territories and Crown Dependencies and all associated narrative regarding comparisons has been updated accordingly.	Section 10.9.4.3.2.1 Table 10.63 Table 10.64
DMR 231	Page 814: Emissions from overseas territories and crown dependencies are not included in UK carbon budgets, so it is not clear that discussion of UK carbon budgets is relevant. This comment also applies to sections 10.9.4.5.5 (p833) and 10.9.6.1.1 (p835).	It is acknowledged that the Falkland Island emissions are reported to the UNFCCC as part of the UK emissions totals, but that UK ratification of the Paris Agreement has not yet been extended to the Falkland Islands as an Oversea Territories. Therefore emissions from all OTs and Crown Dependencies are not included within the UK Nationally Determined Contribution (NDC) and are therefore not included in the UK Carbon Budget. At the time of writing there are no budgets assigned to Falkland Islands and there is little guidance on what such allowances may be. However, the Information to facilitate Clarity, Transparency and Understanding (ICTU) which accompanies the UK NDC makes a commitment to 'Updating on the progress made in expanding the territorial scope of the NDC to include the UK's Crown Dependencies and Overseas Territories'. It is anticipated that should the Carbon Budgets be	Section 10.9.4.3.3 Table 10.67

Reference	Request for information	Navitas response	Addressed
		extended to include the OT/CDs, they will not be dramatically increased and the UK Carbon Budgets as they stand have been used as the only point of comparison available at this time. Table 10.62 will be updated with a footnote to explain the above and Navitas will follow all guidance and future legislation that results should the UK ratification of the Paris Agreement be extended to the Falkland Islands.	
DMR 232	Page 816: The fourth bullet point in the second cell of table 10.63 starts “d water” – presumably there is a missing word (“heated”?)	Thank you for your comment. This is noted and the text will be amended.	Section 10.9.4.4.1 Table 10.69
DMR 233	Page 823: The first two hyperlinks in the footnotes do not work.	Thank you for your comment. This is noted and the text will be amended.	Section 10.9.4.4.3 Table 10.71
DMR 234	Page 833: The percentage figures for NOx and SOx are a little misleading as they are comparing whole project life emissions with annual emissions. It would be better to compare the annual emissions like-for-like.	Agreed. This is a typo as the narrative indicates that the 'worst-case annual baseline Phase 1 & 2' is compared, BUT then the Phase 1&2 total is used, which creates an overestimation of the contribution. The narrative will be updated to reflect the annual NOx and SOx emissions as follows: - NOx = total 31,522 tNOx / 32.6 years = 967 tNOx per year = 0.14% - SOx = total 1,799 tSOx / 32.6 years = 55 tSOx per year = 0.04% Also, the graphic showing the indirect emissions graphically will be replaced with a table showing the actual data over time as taken from Table ES 3 in the Final UK greenhouse gas emissions national statistics 1990-2021.	Section 10.9.4.5.6
DMR 235	Page 834: There are more frequent testing thresholds for higher tonnages (e.g., at least 6 months for 50-500 tonnes, 3 months for 500+).	Thank you for your comment. This is noted and the text will be amended.	Section 10.9.5.2

Reference	Request for information	Navitas response	Addressed
DMR 236	Page 843: There is some partially-hidden text to the bottom right of figure 10-42.	Thank you for your comment. This is noted and the text will be amended.	Section 10.10.1
DMR 237	Page 846: It is surprising that LTVs are missed off the list of sources of waste.	It is expected that the LTVs will generate very little waste. They shall arrive with their cargo ready to be installed. The small amount of waste that they do generate shall be passed onto the OCVs and field support OSV and has been included in their figures. Dunnage and packing materials which are not transferred over to the other vessels shall be transported back to their point of origin when the vessel returns from the project. Navitas will ensure that there is clarity regarding LTV waste in the post-consultation EIS.	Section 10.10
DMR 238	Page 849: Is the atmosphere not a receptor (for emissions from incineration, the shipping of waste and landfill)?	It is not the base case that there will be a standalone waste incinerator on the supply base; the base case is that all waste incineration will be handled by the FIG municipal facility. Equally Navitas will not own the landfill facility used for any waste falling to landfill. Therefore, emissions resulting from the combustion during waste incineration, and the emission of methane from landfill sites are included within the GHG Protocol Scope 3, Category 5 emissions and therefore qualify as Scope 1 emissions for those who are managing the waste facilities. While Navitas recognise that the inclusion of the category 11 Scope 3 emissions was the subject of the Surrey *vs.* Finch Supreme Court ruling, in the absence of formal guidance on the ramifications of this, the emissions associated with waste managed by other parties is considered to be outwith the scope of this EIS.	Section 10.10.3 Table 10.72

Reference	Request for information	Navitas response	Addressed
		Nonetheless, emissions from waste incineration are relatively small and have been itemised in a footnote in Table 10.72. The emissions associated with any shipment of waste back to the UK on returning freighter vessels are included within the vessels emissions captured within Chapter 10.9. If Navitas were to include emissions both from the shipment of waste and arising from local incineration, this would constitute double-counting - the emissions arising from shipping the waste constitute the worst-case and these are included in the assessment. However, 'atmosphere' has been added as a potential receptor for waste in 10.10.3.	
DMR 239	Page 853: The planned incinerator will not be operable in 2024 – more likely to be Q1 2026.	At the time of writing the EIS, the incinerator was anticipated in 2024. Communication from FIG suggests that it is now anticipated towards the end of 2026. Navitas will update the post-consultation EIS accordingly.	Section 10.10.4.2.3
DMR 240	Page 860: In table 10.76 the total amount of waste is given as 28,537 tonnes, but the total of the stages is 28,569. This difference seems too large to be accounted for by rounding errors.	This will be checked and corrected in the post-consultation EIS.	Table 10.85
DMR 241	Page 861: Why are different years' figures used for recycling and landfill rates?	These are the figures reported on the DEFRA website (DEFRA, 2023). Navitas will ensure that consistent years figures are provided in the post-consultation EIS.	Section 10.10.4.5 Table 10.87
DMR 242	Page 872: The correct name of the law is "Marine Mammals Ordinance 1992"	Thank you for your comment. This is noted and the text will be amended.	Section 10.11.1.1
DMR 243	Page 874: The hyperlinks in figure 10-46 do not work.	Thank you for your comment. This is noted and the text will be amended in the post-consultation EIS.	Section 10.11.4.2

Reference	Request for information	Navitas response	Addressed
DMR 244	Page 876: The text about sei whales appears to be contradictory, stating "Tend to swim just below the surface leaving a clear trail of 'fluke prints'" but then goes on to state that they are "relatively difficult to detect visually" and exhibit "relatively inconspicuous behaviour on the surface".	Both statements are correct but will be reworded for clarity in the post-consultation EIS.	Section 10.11.4.3.2
DMR 245	Page 876: The sentence "This process that 10 species have populations which trigger global KBA criteria…" does not appear to make sense. Is there a word missing?	Thank you for your comment. This is noted and the text will be clarified in the post-consultation EIS.	Section 10.11.4.3.2
DMR 246	Page 878: Is the 0.9 on the y axis 0.9% or 90%?	Thank you for your comment. This is noted and the text will be clarified in the post-consultation EIS.	Section 10.11.4.4.1 Figure 10-51
DMR 247	Page 885: Is there more recent data on port visits than 2014?	Yes and the section reference will be added in the post-consultation EIS.	Section 10.11.9
DMR 248	Page 916: Earwigs first appeared in the Falkland in the 1990s according to SAERI.	The exact date is not known. SAERI has commented to Navitas that, anecdotally, it is likely they arrived in the mid 90s.	Section 10.13.4.1.1
DMR 249	Page 918: It is stated that "The TDF will be equipped with monitoring devices and equipment to clean any cargo that does not meet the specified standards." Will it have a designated cleaning area where runoff from cleaning is captured for disposal rather than potentially entering waterways?	Thank you for noting this. This is an error. In accordance with Navitas' shipping instructions and Biosecurity Management Plan all imported goods / cargo will be inspected and treated prior to departure from their point of loading. However, in the unlikely event of an incident the supply base (not the TDF) will have a dedicated biosecurity area where non-conforming cargo can be quarantined, inspected and treated. Any waste generated from this exercise will be dealt with in accordance with the operational Waste Management Plan. The (currently draft) waste management procedure will be upgraded to an operational waste management plan prior to operations commencing. A biosecurity plan will also be prepared pre operations. In the event of a biosecurity incident, FIG Biosecurity will be informed	Section 10.13.5.1.1

Reference	Request for information	Navitas response	Addressed
		and asked to advise on required treatment and disposal. A dedicated biosecurity bin can be provided in the supply yard waste area to ensure appropriate segregation and disposal. The post-consultation EIS will be updated to ensure that the narrative discussing biosecurity monitoring and management is clear. See also SAMS 24.	
DMR 250	Page 926: The third paragraph refers to table "11." which is presumably meant to be 11.1.	The typo will be corrected in the post-consultation EIS.	Section 11.1.1
DMR 251	Page 926: The note states that "other impacts associated with vessel use, competition for resource and the installation of subsea infrastructure etc. are described elsewhere in this document, as described in Table 11.1" but table 11.1 does not state where these are described. Should this refer to table 2.2 instead?	The typo will be corrected in the post-consultation EIS.	Section 11.1.1
DMR 252	Page 932: As well as damage to subsea infrastructure, should oil spillage be added a potential outcome/impact of snagging of fishing gear from trawlers? Same comment applies to table 11.8 (page 942).	The Jee report (2013) presented in the EIS concluded that there is negligible risk of snagging with subsea infrastructure and that there is, therefore, no need to make the subsea infrastructure over trawlable. The risk of loss of hydrocarbons is negligible and is therefore not assessed further.	N/A
DMR 253	Page 949: Why has a different analogous ship been used for OCVs for offshore (*Skandi Skansen*) and inshore (*Seven Arctic* Inst vessel)? Why has a different analogous ship been used for PSVs for Stanley Harbour and Berkeley Sound (the one for Stanley Harbour (Pacific Leader) is the same one listed for offshore comparison)?	These vessels are all similar and it is important to have a range of vessels (albeit limited) to provide the comparative information. For example there are over 400 suitable PSVs in the global market for this project. Availability, locality, maintenance record, environmental features and commerciality will all come into the mix when selecting the vessels and so providing a couple of analogous vessels throughout the EIS should not be a concern and reflects the depth of the market and Navitas' experience.	N/A

Reference	Request for information	Navitas response	Addressed
DMR 254	Page 950: 2023 vessel visit data be better (if available) than the COVID-affected 2022 data. 2022 is not an appropriate baseline.	2023 data will be requested and included in the post-consultation EIS.	Section 11.2.4.2.1.1 Table 11.13
DMR 255	Page 951: It is stated that "the annual variation is related to the catch recorded in the *Illex* jigging fishery which has varied hugely over the past ten years; from virtually zero in 2009 to almost 200,000 tonnes in 2021 (FIG, 2023) (Table 11.15)." However: • Table 11.15 does not include data for 2009 (it only goes back to 2013). • The highest catch on the table was in 2015 (357,722 tonnes) • 2021's catch was 172,537 tonnes, which is probably not correctly described as "almost 200,000"	Navitas will clarify in the text in the post-consultation EIS.	Section 11.2.4.2.1.2
DMR 256	Page 965: The statement that "socio-economic impacts are out of scope for this EIS" is contradicted by the statement later on the same page that "the social impacts of competition for resources such as accommodation was considered to be within the scope of the EIS". This comment also applies to section 11.4.1 (page 979) and 11.7.1 (page 1017)	As noted in section 6.2.2.1.1, discussion with FIG in 2015 determined what socio-economics aspects should be included in an EIS. Socio-economic impacts were considered out of scope but social impacts were included. This is reflected in the FIG Hydrocarbons Environmental Impact Assessment Guidance Note (2016). The post-consultation EIS text will be reviewed to explore whether it can be made more clear.	Section 11.3.1
DMR 257	Page 971: Does Navitas believe there is sufficient time to identify and purchase a site and then build the hostel-type accommodation before operations start?	Navitas has already engaged with local supply chain regarding accommodation requirement and issued an expression of interest to gauge interest, capacity for construction and availability of land. The accommodation can be constructed in a phased fashion, so that not all of the requirement needs to be available at the outset. There are temporary pre-fabricated solutions that can be deployed in the early stages if there is a challenge in constructing more permanent accommodation solutions prior to the	N/A

Reference	Request for information	Navitas response	Addressed
		commencement of operations. These have been deployed successfully for previous exploration campaigns.	
DMR 258	Page 974: DMR disagrees that the significance of the impact on housing is low. There is a severe housing shortage and even only 26 additional homes is still equivalent to 2% of the 2021 level (1,148).	Rather than increasing pressure on existing (limited) supply, Navitas is committed to the construction of additional accommodation units to meet its direct housing requirement, therefore we consider the rating appropriate. The measures being taken to accommodate the workers have been taken into account when considering the severity of effect. As the addition of accommodation required by Navitas is only 2 % change, the assessment looks at the worst-case and is precautionary, Navitas feel the assessment is appropriate. Currently the assessment is sensitivity Low 'The receptor is tolerant of change without detriment to its character, or unacceptable to a handful of stakeholders' and Severity Minor: 'Short-term minor impact on livelihood and/or health, inconvenience of resource use, minor levels of disturbance to local pop, concern to a handful of stakeholders'. Wider aspects of the impact of the development on accommodation are considered in the SIA.	N/A
DMR 259	Page 981: Would the natural environment also be a potential receptor if more water needed to be extracted for use in Stanley?	This section of the EIS focusses on the competition of a resource (water) on the human population. As such, the natural environment would not be considered a receptor in this case. The volume of water to be extracted from the natural supply is managed by FIG and Navitas will be one of many end users.	N/A

Reference	Request for information	Navitas response	Addressed
DMR 260	Page 981: The number of Stanley households is 1,148 (not 1,147) according to the census figures.	At the time of writing, census data tables and specific data requests were kindly provided by FIG Policy, Economy and Corporate Services prior to the census being issued. The census data tables sent through by FIG prior to the census being published noted 1,523 resident households (1,147 in Stanley). This will be updated to reflect the final census report numbers.	Section 11.4.4.1
DMR 261	Page 989: Why is the estimated water use for MODU drilling and vessel requirements so much lower for the project than the 2015 exploration?	This difference arises because the 2015 exploration wells were drilled with WBM and the development wells are to be drilled with NADF. This is noted in Table 11.22, Navitas will add a reference so this is clearer.	Table 11.23
DMR 262	Page 1002: Is the heliops hangar for Sea Lion expected to be the same size as the one used for the exploration campaign? What if SAR operations also have to be provided from Stanley Airport (if MOD will not agree to Navitas using theirs)	Full specification/design of the helicopter hangar to be determined, but it will be designed with sufficient capacity to store and maintain the airframes anticipated. The hangar is expected to be of a similar size to the RUBB hangar that serviced the 2015-16 exploration campaign at Stanley Airport. That hangar housed 2 crew change helicopters and a dedicated SAR airframe (SAR was not provided by the MoD in the 2015-16 exploration campaign). As such a hangar of this size would be capable of meeting maximum anticipated airframe storage requirements.	N/A
DMR 263	Page 1005: Why have roof-mounted solar PV panels not been considered as a way of reducing demand on grid power, especially given the highest power demand (midday) correlates with peak solar radiation?	PWD Power Station indicated to Navitas their view that individual roof mounted solar panels are not optimally compatible with Stanley's existing power generation and distribution infrastructure. This is because any excess energy generated by these cannot be easily absorbed/disposed of, nor can the spikes in demand created on dull days in which the panels are	N/A

Reference	Request for information	Navitas response	Addressed
		less efficient be accommodated by grid power generation. This situation will be monitored in close consultation with FIG as the project progresses and as power generation and distribution infrastructure and technologies advance.	
DMR 264	Page 1010: Presumably personnel will also need air transportation mid-contract for holidays etc, rather than just at the start and end of contracts?	To present the worst-case scenario that the EIS figures have been based on, all positions (other than the Country Manager role) have been made rotational (28 days on - 28 days off) therefore holidays are part of the 28 days off and no 'mid-contract' breaks are expected.	N/A
DMR 265	Page 1011: Presumably it should be “9 seats / week on the air-bridge”, as 9 seats / flight would mean the weekly unallocated capacity was 112 seats rather than 103.	Thank you for your comment. This is noted and will be amended.	Section 11.6.4.1
DMR 266	Page 1012: Do the figures in table 11.29 account for holiday/school trips by staff based permanently in the Falklands (and their family members)?	The figures account for holidays but not for extended family members' school trips as Navitas does not yet know the make up for the full team and so focused purely on the position and not their potential extended family. Direct Sea Lion staff will either be expats employed to work in the Falklands on a rotational, and unaccompanied, basis or they will be existing Falkland Islands residents who transfer employment to work in the Sea Lion project. It is most likely that existing Falkland Islands residents will be the only Sea Lion staff who have dependents within the Falkland Islands and as such their demand for flights will be unchanged. If rotational staff are permitted to utilise the charter flight for family members, this will only be prioritised in the event of spare capacity.	N/A

Reference	Request for information	Navitas response	Addressed
		It is anticipated that there will be spare capacity on charter flights which can be utilised by personnel engaged on the project and/or their dependents, or otherwise (with the agreement of FIG) on-sold to community members. Air passenger seat availability will also be covered in the Socio-Economic Impact Assessment.	
DMR 267	Page 1018: Would Navitas consider committing to covering the cost of fully sealing the Coastel Road as part of its project preparation?	Navitas was a signatory to a joint industry letter to FIG (led by FIFCA) requesting that Coastel Road be sealed (sent on 22/01/24 to the Director of PWD by James Bates). At this time Navitas would not consider to committing to covering the cost of fully sealing the Coastel Road.	N/A
DMR 268	Page 1024: Would a degradation in air quality from diesel particulates not be a potential impact to the human population?	Air quality is listed as a receptor in Section 11.7.3 and an impact assessment section will be added.	Section 11.7.3 Section 11.7.6.1
DMR 269	Page 1043: Why has turning off yard lights when not required not a mitigation measure?	This is a valid point. It was not specifically mentioned because it is simply expected that lights will be switched off when all yard activity has finished at night. This will be standard practice. To be clear there will be a number of security lights but yes, the operational lights and office lights will all be switched off each evening once operations have ceased for the day. This is considered standard practice rather than a mitigation as such. However Navitas can add clarity to the post-consultation EIS text to explain that it will be normal practice to switch off any lighting that is not required operationally.	Section 11.8.7.1

Reference	Request for information	Navitas response	Addressed
DMR 270	Page 1057: There is not currently a heliport in or close to Stanley.	Navitas intends to develop a heliport at Stanley airport in conjunction with FIG and that this will be constructed in time to support Sea Lion Phase 1 and 2 operations. Stanley Airport has previously supported helicopter operations for the various exploration drilling campaigns. The text will be amended for clarity.	Section 11.9.4.3.3
DMR 271	Page 1059: Was noise from lifting and loading on the TDF or in the yard considered for table 11.48? What would these noise levels be?	Lifting and loading noises were not specifically included but reversing alarms were as well as the noise of vessels, see Table 11.48. It is anticipated the lifting and loading at the base will be less than that experienced during an offload of the Unispirit as the vessels and cranes will be smaller. Navitas will add a note to the post-consultation EIS explaining that noise sources are a selection of the significant noise sources of different levels and characters to judge the likelihood of nuisance.	Section 11.9.4.3.3
DMR 272	Page 1061: Was lifting and loading noise modelled? Only engine noise appears to have been considered despite lifting/loading noise being identified as an issue in table 11.49. What noise levels would be expected from lifting and loading?	Engine noise makes up the vast amount of noise generated during lifting and loading operations as the vessel engines will be on to enable safe manoeuvres, and the cranes will be operating using generators on the vessels. Navitas will add a note to the post-consultation EIS to clarify that lifting and loading noise is included in the vessel noise estimate.	Section 11.9.4.5.2 Section 11.9.4.4.1 Table 11.47
DMR 273	Page 1077: The Offshore Petroleum (Licensing) Regulations 2000 should also be listed.	Thank you for your comment. This is noted and the text will be amended.	Section 12.1.1.1
DMR 274	Page 1084: When are tests on pelts and fur adhesion likely to take place?	This will be conducted prior to drilling commencing and in sufficient time to inform key operational documents including ERPs and OPEPs, subject to	Section 1.7.1.1.2 Section 7.2.4.1 Section 15.7.6

Reference	Request for information	Navitas response	Addressed
		import permits (for France). Navitas will include indicative timing in EMMP Chapter 15.	
DMR 275	Page 1084: Is sheen formation expected to be higher or lower at lower sea temperatures?	Sea Lion crude does not produce a visible sheen at 18 degrees. It will is therefore not expected to produce a sheen a lower water temperatures, please refer to Table 12.1 on sheen formation.	N/A
DMR 276	Page 1103: Is 21 days a worst-case scenario for stopping a well blow-out? Macondo took 86 days to stop the flow of oil and was located in an area that is not as hard to transport equipment to as the Falklands.	Navitas has assessed the availability of capping stack devices and the timing for their deployment to the Falkland Islands. 21 days is considered a credible worst-case timeline for deployment. Capping stack availability has advanced since the Macondo spill in 2010 and capping stacks that can be transported by air have been developed.	N/A
DMR 277	Page 1137: Due to the low quality of the images, the legend of the scale bar is illegible in figures 12-33 and 12-34.	Navitas notes DMR's comments in relation to Figures and suggest this may be a compression issue. The original figures are all high resolution and will be checked throughout for this issue. Please note a hi-resolution copy of the EIS may be requested if required.	All Figures checked for resolution and improved where possible
DMR 278	Page 1138: The 180 cubic metres being recovered seems unlikely to equate to up to 60% of the post-evaporation spillage given previously it is suggested (page 1,121) that only around 7% of Sea Lion crude would evaporate at the surface.	This represents two very different scenarios and time lines. The transfer spill can be contained more rapidly. The 7 % relates to the quantity modelled for an FPSO release.	N/A
DMR 279	Page 1148: Rather than rely on bringing in a well capping device if there is a blow-out, can Navitas not keep one in the Falklands for the duration of the project in case one is required?	There are a limited number of specialised well-capping devices and supporting equipment and resources available globally. They form part of a shared contingency plan across the wider Oil and Gas Industry. To locate one in the Falkland Islands long term would be difficult logistically and would hinder contingency plans for other operators.	N/A

Reference	Request for information	Navitas response	Addressed
DMR 280	Page 1157: In the first paragraph, the % of oil reaching the shoreline and mass of beached oil is stated to higher in the loss of FPSO crude inventory scenario compared to the well blowout scenario, but the text goes on to state “The potential deposition in sediments is also much smaller”. This is confusing.	This will be clarified in the text.	Section 12.1.6.2.1
DMR 281	Page 1178: The FPSO exclusion zone is 1250m not 500m.	Thank you for your comment. As described in Section 5.5.4 the FPSO will have an exclusion zone of 1,275m. This will be checked and updated throughout the document to check for typos.	Section 12.1.12
DMR 282	Page 1201: Re “a wide spectrum oil skimmers”, would there be one of these or several?	There will be several; 2 skimmers on each Offshore Support Vessel and 10 in the Stanley supply base. The typo will be addressed in the post-consultation EIS. See also DMR 55.	Section 5.11.1.2.3 Section 12.2.5.1
DMR 283	Pages 1207-1210, 1211: Given the large difference in spillage volumes between the two scenarios and the same level of likelihood (unlikely), it seems odd that the overall significance of the risk to various receptors is the same for both scenarios – one would expect that a spill 120 times larger (1,200 tonnes *vs.* 10 tonnes) would have a much higher overall risk significance, particularly on seabirds and marine mammals given large areas of the eastern end of Berkeley Sound that they are concentrated in would be covered by a sheen in the 1200 tonnes scenario.	This is due to the precautionary approach. It is expected that the likelihood of a vessel collision resulting in a release of 1,200 tonnes of MGO would be 'Very Unlikely' ('Impact almost never observed, few if any events in the industry, failure of nearly all operational controls would be required'). However, as there will be vessels in Berkeley Sound which are operated by third parties e.g., fishing vessels etc, adherence to operational control will be outwith Navitas sphere of influence. Therefore, the likelihood of occurrence was elevated to 'Likely' to take a precautionary approach.	N/A
DMR 284	Page 1211: How would “Enhanced crew bunkering competency” be attained?	This will be attained as follows: 1. Identified by Navitas' Offshore Bunkering Procedure and the Area Specific Operational Guidelines (ASOGs),	Section 12.2.7

Reference	Request for information	Navitas response	Addressed
		2. Achieved by a Hazard Identification and Risk Assessment (HIRA) once the marine contractor for the OSVs has been selected, and 3. Verified by Job Safety Assessments and Tool Box Talks prior to each operation. In addition, regular drills and Navitas' Audit and Assurance Procedure will assure crews achieve and retain the required level of competency. Please note that Section 5.10 and Table 4.4 both refer to the use of dedicated tanker berthing crews to supplement the CTT crew thus ensuring the required standard of competency is met for every offtake operation. Explanation of measures to ensure bunkering crew competency will be added to the post-consultation EIS.	
DMR 285	Page 1214: The HMP is listed as a project-specific mitigation for the risk to Berkeley Sound, but wording elsewhere (page 108) suggest the HMP will only cover Stanley Harbour.	Text will be clarified in section 12.2.12 to indicate only Stanley Harbour is included in the HMP.	Section 12.2.12
DMR 286	Page 1219: Would tourism not be a potential receptor given Stanley Harbour is one of the most visited locations in the Falklands?	Thank you for your comment. This is noted and will be added.	Section 12.3.3
DMR 287	Page 1236: Table 13.1 does not seem to be consistent with the contents of table 9.1. For example, table 9.1 identifies Placement and presence of objects on the seabed as affecting benthos, the seabed/soil and human population. Table 13.1 identifies disturbance to seabed/placement of objects as affecting plankton, benthos, fish, seabed and water quality, but not humans. Several of the same queries raised above re table 9.1 apply here (e.g., why are benthos not deemed to be impacted by underwater	These will be checked and cross-referenced and updated where necessary. Footnotes have been added where necessary for clarity.	Chapter 9 Section 13.2

Reference	Request for information	Navitas response	Addressed
	noise). Other queries include: • Are humans not impacted by artificial light and onshore disturbance from helicopters? • Are other users of the sea not potentially impacted by the placement of objects on the sea bed due to the potential for trawling nets to be caught? • How does unplanned venting of gas affect commercial fisheries?		
DMR 288	Page 1263: Combustion of sold product fits the requirements for needing an EMMP action (risk being upper moderate and confidence being uncertain) but is not included.	While the impact assessment rating for emissions from sold product theoretically meets the criteria for inclusion in the EMMP, there is no policy guidance for this at this juncture, and it is difficult to conceive of a Monitoring and Management Action that would provide a consistent and auditable end use. All quantities of export volumes will be recorded. It is beyond the seller's ability to influence the use of the product once it has been sold or monitor and manage emissions arising, thus the end user's emissions will be their responsibility to monitor, manage and report; their scope 1 & 2 and will be considered Navitas' scope 3. A conservative assumption of Navitas' Scope 3 sold product emissions (all being combusted) were included in the EIS. The confidence rating is uncertain as it is not possible to determine what the end uses of the product will be, and consequently a worst-case has been applied to the assessment.	Section 10.9.10
DMR 289	Page 1288: Combustion of sold product is missing from the list of significant residual impacts.	Thank you for your comment. This is noted and the text will be amended.	Section 16.2
DMR 290	Page 1300: Should the definition of Endemic be “Native to or confined to a particular region”?	Typo, this will be corrected.	Chapter 18

DMR 291	Page 1365: The IUCN statuses should be updated to 2024.	Will check and amend where necessary to 2024 listing.	Appendix 1
Offshore Petroleum Regulator for Environment and Decommissioning			
OPRED 1	For the UKCS we would anticipate a commitment to using chemicals in line with the Offshore Chemical Notification Scheme (OCNS) but it is understood that the chemical requirements for FIG may differ. The section states chemicals will be chosen to minimise environmental impact however there is no committal within section 5.9.1 of these being OCNS ranked products. Although this is stated in section 10.6.1.1.2 it would be beneficial to be clear at the front end of the documentation for all chemical usage.	Thank you for your comment. This is noted and will be amended.	Section 5.9.1
OPRED 2	The onshore construction is stated within the EIS to have an anticipated start date of Q3 2024. To note, this is likely out of date due to being in Q3 and the project being examined at this point	At the time of writing the EIS it was anticipated that replacement of the TDF causeway would commence in Q4 2024. The regulatory approval timeframe has extended so that such onshore construction works are not anticipated to commence until 2025. Navitas will update the target date for commencement of the TDF causeway replacement in the post-consultation EIS.	Section 5.11.4.2.4
OPRED 3	The UKCS has a clear seabed principle with respect to end of field life. The aim should be not to leave subsea equipment in situ. . Decommissioning in design is also a requirement of International Maritime Organisation (IMO) regulations. Whilst the decommissioning aspect of the field will be subject to a further impact assessment at the time it should be clear that the field development meets the criteria of decommissioning in design and clear seabed principles.	As stated in the EIS, 'Decommissioning will be carried out in accordance with the legislation in place at the time'. At the time of writing, the project defers to the current UK legislation and its sources. OSPAR Decision 98/3 on the Disposal of Disused Offshore Installations prohibits dumping, and leaving wholly or partly in place, of disused offshore installations within the OSPAR maritime area. While derogation from this prohibition may be sought for qualifying installations, e.g., large steel or concrete footings of fixed platforms, this will not apply to the proposed project which will utilise an FPSO with	Section 5.12

Reference	Request for information	Navitas response	Addressed
		subsea wellheads and infrastructure. Under OSPAR, all subsea structures must be removed with any associated piles, well conductors etc. cut to a level below the natural seabed which ensures they remain below the seabed in the face of prevailing conditions. Of importance, pipelines and other structures which are listed in a UK Pipeline Works Authorisation are excluded from OSPAR Decision 98/3 and in the UK, decommissioning of these is managed in line with the Petroleum Act 1998 (Part IV) and the Pipeline Safety Regulations 1996. These require a similar assumption of complete removal where reuse of the pipeline and associated structures for further hydrocarbon development is not possible. However, under the UK regulations, there are certain pipelines and/or circumstances in which a pipeline may be wholly or partially left in situ e.g., pipelines that are adequately buried or trenched and are not subject to development of spans, and are expected to remain so. However, the decision to do so would need to be informed by an EIS which is supported by a formal Comparative Assessment of the options which must include a robust assessment of the environmental impact of removal *vs.* that of leaving wholly or partially in situ. Part V of the Offshore Minerals Ordinance 1994 confers obligations for decommissioning. A decommissioning programme has to be approved by FIG in advance. FIG has powers under the Ordinance to develop additional regulations in relation to field	

Reference	Request for information	Navitas response	Addressed
		decommissioning. As stated in Section 5.12 of the EIS: '…in line with the current legislation, the Phase 1 & 2 Development infrastructure has been designed to enable complete removal of all structures. Equally, the flowlines will be surface laid and will not be trenched or buried thus facilitating complete removal (noting that the seabed is very soft, so flowlines may self-bury which could change the methods required for complete removal).' Also in line with legislation, all relevant 'As Left' surveys will be carried out to ensure that the seabed is left clear. The Sea Lion Phase 1 and 2 offshore installation and subsea infrastructure has been designed so that it can be removed completely and the seabed left clear. Therefore the project has been designed with compliance to current regulation in mind and Navitas will comply with the prevailing legislation at the time of decommissioning.	
OPRED 4	The production profile of the P50 case in the EIS does not appear to align with the production profile in the field development plan (FDP) with differing P50's provided with the exception of table 14 within the FDP. This makes it difficult to read across from the FDP to the EIS to be able to confirm/interpret (Section 4.2.2 of FDP). In addition, this section fails to demonstrate the profile over the field life e.g., OPRED would expect tables to describe expected production for that year in both the FDP and the EIS in the same units to fully confirm that this aligns and has been assessed properly. Table 10.63 also appears to have a typographical error as power generation	Both P50 production profiles within the EIS and FDP deliver 306.9 MMBO over a 30 year production life. All volumetric references in the EIS are rounded to 1 decimal place (306.9 MMBO), whilst the FDP doesn't round to decimal places (307 MMBO). Production tables were provided to FIG using the Standard Economic Template (SET). Section 5.8.2.1.1 and Table 10.63 will be checked to ensure consistency in metrics used. Figure 5-8 will be updated to include the production profiles of P10, P50 and P90.	Section 5.8.2.2.1 Figure 5-8 Table 10.69

Reference	Request for information	Navitas response	Addressed
	is presented as P50 306.9 Mstb whilst combustion of sold product contained within the same table is presented as 306.9 MMstb. There is also an error in the text which states “Table x presents the production profile of oil”.		
OPRED 5	There is a typographical error - “medium sized” - should this be “medium sized”?	Thank you for your comment. This is noted and will be amended.	Section 7.4.4.2.3.2
OPRED 6	A date has been stated for construction which is in the past. However, the current schedule expects that, during Stage 1, a maximum of two LTVs will be present in Berkeley Sound for only eight months (c. August-2022 to end March-2023). The EIS should be based on future works and as stage 1 construction has not yet started this date is incorrect.	Thank you for your comment. This is noted and will be amended.	Section 10.1.2
OPRED 7	The section states “Monitoring of light-related impacts forms part of the EMMP (Chapter X) and further mitigation will be discussed should adverse impacts be identified.” However, the section is project specific mitigations, and the subsequent table of impacts (Table 10.8) shows the impact of bird strike for offshore and inshore lighting to be moderate. The statement within the EIS and conclusions drawn in the table are contradictory.	Navitas does not consider monitoring to be synonymous with mitigation. The initial impact assessment re bird-strikes is listed as Moderate. Because this is significant, project-specific mitigations are then considered. While numerous mitigation measures exist, at this time and stage in the project Navitas identify only two measures ('Reduce light pollution by auditing and, dousing of unrequired lights') as reasonable. While these will be deployed, they are not considered to be sufficient to reduce the impact in the residual assessment and it is recognised that further mitigation will be required. The main mitigation measure is to follow the guidelines of the OSPAR Agreement 2015-08, the purpose of which is to minimise pollution of the northeast Atlantic and North Sea including light pollution. However, this in turn requires a series of options to be investigated and balanced with safety	Section 10.1.8 Section 15.6.2.1.2 Section 15.7.1

Reference	Request for information	Navitas response	Addressed
		and operational imperatives. The practicalities of adopting the OSPAR green lighting strategy will be investigated during the project engineering phases as a potential further mitigation against bird-strikes but, until this is done, green lighting is not included as a means to reduce the residual impact/risk and is not factored into the assessment. In short, until the feasibility of further options has been explored in FEED, the residual impacts remains Moderate. Navitas will review the narrative in the post-consultation EIS to clarify that further mitigation measures will be explored in the FEED process and that the monitoring will serve to ground-truth the impact assessment and adjust the use of mitigation measures as necessary.	
OPRED 8	It is unclear why it is only wellbore clean-up and completion fluids which are planned to be selected in line with OCNS. It would be expected that all the chemicals in the table should be. Please confirm - described later in section however should be clear throughout.	Thank you for your comment. This is noted and will be amended.	Section 10.7.4.1.1 Table 10.45
OPRED 9	The use of Risk Based Approach (RBA) for Produced water (PW) is stated as a mitigation/control measure. OPRED question if this is feasible given the distance away from laboratory facilities capable of undertaking this and the degradation time of the sample.	There will be a de-gasser and OiW monitor automatic instrumentation and ongoing laboratory analysis twice a shift by a lab tech on board the FPSO, with appropriate laboratory analysis equipment. Navitas is committed to having appropriate laboratory facilities and equipment available, and to independent verification. Laboratory facilities will be developed onshore as necessary.	Section 10.7.5

Reference	Request for information	Navitas response	Addressed
OPRED 10	There is insufficient detail provided within this section. The single statement does not include any trends. OPRED would consider that figures are not stable and would incur fluctuations. For example, it is unlikely to remain stable over the field life. A graph reflecting the trends over time would be much more meaningful as a baseline.	Navitas recognise that the use of a single number to indicate global energy demand is less than ideal. However reliable data on trends in global demand/supply are difficult to establish as most information has a bias toward the continued sanction of O&G projects, or the cessation of all development. Therefore it was difficult to identify a measured and unbiased baseline trend. In the absence of trustworthy, unbiased and respectable sources for such a data set, Navitas opted to use the data provided by the IEA (2023). While a forecast is provided in this report, it extends only from 2017 to 2030 and therefore didn't seem fit for purpose. While a range from various sources could be added to provide a context, the chapter is already a complicated one and Navitas opted to avoid adding numerous extra figures. To overcome this concern re bias, in the post-consultation EIS Navitas will reference the 'Resources for the Future' which synthesises 15 different projections of oil demand including the BP Energy Outlook; https://media.rff.org/documents/Report_23-02_NPKKYws.pdf	Section 10.9.4.3.4 **Error! Reference source not found.** Section 10.9.4.5.7 Table 10.80 Section 10.9.6.1.3
OPRED 11	Inclusion over how long phase 1 and phase 2 will be in comparison to the field life duration would provide context to the figures presented. An assessment of trends cannot be made with the information presented.	**Initial consultation response:** Total project time = 32.6 years Stage 1- 2.6 years = 8% of total project time Stage 2 - 2.9 years =9% of total project time Stage 3 - 27.1 years = 83% of total project time	N/A

Reference	Request for information	Navitas response	Addressed
		These figures will be added to the relevant table headers throughout the chapter. **Post-consultation comment:** Efforts were made to include these extra indicators of stage durations but the tables became excessively cluttered and the decision was made that the cost to clarity in an already 'busy' table outweighed the benefit.	
OPRED 12	Within the base case the flare pilot light assumes 0.5mmscfd. The worst-case is 0.7mmscfd. A justification as to why this has increased would be beneficial It is usual that the worst-case operations in terms of impacts would be those experienced within P10 operations as with increased production.	The fuel gas used for the pilot light is realistically expected to be 0.5mmscfd but for the worst-case assessment was elevated to 0.7 mmscfd. Consideration of the P10 - P90 cases was not a part of this decision as the pilot light fuel usage will remain consistent regardless of production rates. Navitas notes the comments and will reduce this to 0.5mmscfd in the worst-case assumptions in the post-consultation EIS and reference the guidance which states that uncertainty is accommodated in this figure.	Section 10.9.4.4.1 Table 10.69
OPRED 13	Sections 10.9.4.4.5.1 and 10.9.4.4.5.2 discusses the emergency/unplanned events, and the a VRP malfunction. The associated figures in Table 10.69 should be included in the worst-case figure. These two scenarios include elevated emissions but have not been included in either the baseline or worst-case scenarios. Table 10.63 - It is unclear why the P50 has been used for the emissions profile. In addition, the average over the field life produces a flat emissions level however this is not the case for operations. Assessing this way reduces	Emissions from process shutdowns and emergency blowdowns are already factored into the emissions estimate. The narrative on flaring provided in Table 10.63 will be updated to state 'process upsets and emergency blowdowns'. Further, for Table 10.66, footnote 4, will be updated to ensure transparency. Therefore the estimates in Table 10.66 do indicate the worst-case emissions of all activities. However it is recognised that this is not reflected in the section	Section 10.9.4.4.1 Table 10.69 Figure 10-40 Section 10.9.4.4.4 Table 10.72 Section 10.9.4.4.5 Table 10.75

Reference	Request for information	Navitas response	Addressed
	the emissions profile over the field life. It also presumes a constant rate of emissions for the life of the field and therefore in early years/higher production years the emissions will exceed what has been assessed in the EIS. This needs re-examining with the inclusion of the production profile anticipated per year and emissions per year of the project presented. Furthermore, it is unclear if the offload vessels energy requirements/heated tanker aspect has been factored in as part of the emissions profile. It is therefore difficult to ascertain if this is correct or not as the information has not been presented.	heading or narrative which indicates 'planned' activities, which will be updated. Of note: - The background calculations were shown and explained to FIG on the 19th August 2024. - Section 10.9.4.4.5 itemises the potential for unplanned emissions that would result from an emergency blowdown / VRP failure. They are unlikely to happen but as stated above, these are captured in the production emissions of Table 10.66. This will be made clearer in the text. - The CO_2e number and totals in Table 10.69 (now Table 10.75) have errors resulting from a copy and paste of tracked changes. These will be corrected and the emissions resulting from a single blowdown are 612 tonnes CO_2e. - The cargo tank sizes on the likely FPSO have now been confirmed and the tonnage of HC gas that would be vented in the worst-case event of VRP failure is now 38.84. - Table 10.69 69 (now Table 10.75) will be updated to reflect this. - The cold gas venting EF will be checked in Table 10.65 (now Table 10.71) Table 10.63 (now Table 10.69). The worst-case production rate commensurate with P10 will be listed in the worst-case column in the table. However, as the emissions estimated are not based on the production rate, this will not effect the actual	

Reference	Request for information	Navitas response	Addressed
		emissions which already encompass the potential for the higher production rate. The P50 production profile, showing the decline in production over time is already presented in Section 5.8.2.2.1 (Development Description) and the P10 - P90 profiles are shown in Section 10.9.4.5.4 on carbon intensity. However, for the sake of context, a figure showing the three production profiles will be added to Section 10.9.4.4.1 and referenced to in Table 10.63 (now Table 10.69 to show the context. Further, the emissions as they occur over the project-lifespan will be presented in Section 10.9.4.4.4 alongside the tabulated estimation figures. Emissions associated with the offload vessels were confirmed by FIG as being outside the boundary of the EIS scope (ref email from DNR 17/05/24).	
OPRED 14	The unit $MtCO_2e$ is used until this is converted to intensity $kgCO_2e/boe$. The text then uses $MtCO_2e$ to include the four well flow back contingency upping the worst-case baseline to 8.99 $MtCO_2e$. This appears to be out of order. Why is this not included in the worst-case prior to converting to intensity? This would allow for a complete comparison with the base case intensity. For transparency, a reference to the conversion methodology to generate the intensity should be included.	The sentence order will be changed to indicate that the carbon intensity data include the four well tests and the wording will be changed in Section 10.9.4.5.4 to indicate that this is not the worst-case baseline intensity but is in fact the worst-case baseline plus contingency intensity.	Section 10.9.4.4.4
OPRED 15	References numbered 5, 6 and 7 are within the body of the text in sections 10.9.4.4.7 and 10.9.4.4.8 but no full references are included in footnotes as per the rest of the document.	These will be included, also note that the background calculations were shown and explained to FIG on the 19th August 2024.	Sections 10.9.4.4.7 Sections 10.9.4.4.8
OPRED 16	It is unclear why the P50 carbon intensity is discussed in this section. The section needs to be expanded to be transparent. The section states that the P90 case is the worst for carbon intensity, and this is presented in figure	The range of carbon intensity is provided in the section already. Therefore, Navitas understand this comment is in relation to the last paragraph in the	Section 10.9.4.5.4

Reference	Request for information	Navitas response	Addressed
	10.39. This is greater than the carbon intensity for the P50 case as shown in figure 10.40. However, the section assesses the P50 and not the P90 case making it unclear.	section which refers to P50 only. The paragraph will be updated to include the range of intensities and to indicate that even the lower production case (P90) carbon intensity, including all vessel and drilling emissions etc, is lower than the NSTA benchmark of 36 kgCO_2/boe.	
OPRED 17	There is insufficient information on the calculation method included. The units should be comparable to ensure that the calculation as well as the assessment is transparent. It is not currently possible to easily emulate your conclusions given that the sold product emissions is given for all products over the entire field life of 30 years compared to a daily global figure. The assessment does not include a realistic like-for-like comparison which can be assessed for the significance impact.	Thank you for the comment. The text is comparing tCO_2e from Sea Lion to total global production in barrels. Navitas will expand on the calculation method and do a similar calculation based on the global production figure using the same emissions factor so the units match. A table will be added to fully show all the emissions cases.	Section 10.9.4.5.7 Table 10.80
OPRED 18	The text states that the average production per year would be 27,800bopd. Does this mean that there will be 27,800 barrels of oil produced every day of that year given bopd means barrels of oil per day? In addition, the jumping between the units MMstb to bopd makes it difficult to follow the trends and is not very transparent when trying to demonstrate the base case for comparison and therefore assessment of this aspect	Yes. The P50 case averaged over the field life is 28,356 bopd. A figure showing the production profile over the field life will be added to Section 10.9.4.4.1 and the conversion of boe to MMstb will be added in brackets alongside the bopd figure. See also response to OPRED 13.	Section 10.9.4.4.1 Table 10.69 Figure 10-40
OPRED 19	It is stated that Sea Lion will not be able to facilitate a zero-flaring approach. Therefore the associated GHG intensity of emissions from operational flaring should be included. There is an inability to meet BAT in line with projected future UK emissions. All routine operational flaring is prohibited for new developments in the UKCS.	Navitas are committed to a zero routine flaring approach and the narrative will be re-worded accordingly. The only baseline flaring that will occur is that associated with commissioning of the GI system and that occurring for safety reasons during unplanned process upsets/emergency blowdowns. The contingency is retained for four well tests should they be deemed necessary. All of the above have been accounted for in the emissions estimate. Zero flaring will occur during routine operations.	Zero routine flaring is already referenced throughout the document. Table 10.74 has been updated.

Reference	Request for information	Navitas response	Addressed
OPRED 20	The section states that in "absolute terms the maximum (P10) estimate of emissions from combusted product is a significant contribution." However, this is not what has been assessed or presented so it is unclear given the P50 case has been used.	The P10 case is assumed to ensure a worst-case estimate for assessing the impact of sold product, as is indicated in Section 10.9.6.1.3. The worst-case assumptions listed in Table 10.63 for the production level will be changed to reflect the P10 case. However, the production level is not indicated in the climate change assessment (Section 10.9.6.6.1) so it is not clear what exactly the comment is referring to. Of note the assumptions listed in Table 10.63 are considered sufficient to encompass emissions associated with the P10 case so changing the production level does not directly affect the emissions estimate. Navitas will update this EIS section to ensure language is clear.	Section 10.9.6.1.3
OPRED 21	It is stated that the worst-case assumption of 100% combustion has been presumed. However, this uses the P50 and the P10 case, which is not what is presented and does not align with the statement made in Section 10.9.6.1.3. Please clarify	Navitas is a little confused by the comment as this section does not specify P50 or P10 and just makes reference to Section 10.9.4.4.8 which provides the full range from P10 - P90. Table 10.72 shows the estimated total atmospheric emissions resulting from O&G operations in the NFB during Field Life and intentionally does not include the emissions that will results from the product once sold. Relevant sections of the post-consultation EIS will be reviewed to ensure that the language is clear.	Section 10.9.6.1.3

Reference	Request for information	Navitas response	Addressed
OPRED 22	The paragraph states that all monitoring requirements will be managed *via* the EMMP. However, table 15.2 does not include emissions (and therefore presumably the EMMP plan) and thus is in contradiction to the statement within the paragraph.	Thank you for your comment. This is noted and the text will be amended accordingly.	Table 15.2
OPRED 23	Section 10.9 (emissions) concludes that impacts remain as moderate and upper moderate for the sold product. However, emissions are not included in the EMMP. Using the criteria (table 15.1) it is not clear why emissions have not been screened in given the impact is certain for project emissions and uncertain for global sold product	See response to DMR 288.	Section 10.9.10.1 Section 15.2
OPRED 24	This does not include an end product emissions rating which was upper moderate - this seems to be an omission in this section.	Thank you for your comment. This is noted and will be included.	Section **Error! Reference source not found.**
OPRED 25	There are multiple responses where the chapter/section has not been cross referenced and XX stated.	This is done to show that the requirement is addressed in multiple chapters, and in the same section within each chapter. For example, acknowledged uncertainties and data gaps are noted in section 10 of each assessment chapter, which is expressed as X.X.10. In chapter 10.1 (artificial light), the uncertainties are noted in section 10.1.10 and so on.	Appendix 2
Scottish Association for Marine Science			
SAMS 1	In the case of Designated Sites, the linkage between Designated Site status and the health of qualifying constituent features has been overlooked (i.e., the reasons as to why sites have received Designated status). Whilst impacts on qualifying features such as birds are relatively robust, there has been a failure to carry through the consequences and relate potential decline in species populations to associated Designated Site status.	Thank you for the comment. Navitas will review and update.	Section 7.5.2
SAMS 2	Regional Air Quality is clearly indicated as a receptor during the ENVironmental Impact IDentification (ENVIID) workshops, with Table 9.1 in Chapter 9 clearly stating that Regional Air Quality had been scoped in, with	The previous EIS submitted by POEPL had a full chapter discussing the potential for impacts from inshore and onshore emissions to air quality, the	Chapter 9 Section 10.9

Reference	Request for information	Navitas response	Addressed
	'further assessment required 'in Chapter 10.9. The subsequent assessments make no recognition of potential impacts at a regional level, with page 795 stating that… "As described in Chapter 9, impacts to air quality have been screened out owing to distance of the offshore location from environmental and social receptors." There is a clear disparity here between what has been highlighted as a result of the ENVIID workshops for consideration within the EIS, and what has received attention. Whilst some of the emissions data presented do have relevance at a regional scale, they are only assessed on a global level. It is likely that an explicit definition of what is regarded as a 'regional' versus 'global' level is required, and data re-examined under this consideration	primary source of which was incineration of waste at the supply base. In the absence of AQO's for the Falkland Islands, those from rural Britain were used as a conservative proxy. Even with a precautionary approach, all the impacts to the receptors (namely the human population and vegetation) were identified as Very Low. In the proposed Navitas Phase 1 & 2 development, an incinerator at the supply base is no longer a base case requirement, in discussion with FIG, it is considered that the municipal incinerator will have capacity to a accommodate the project incinerable wastes. Therefore, when reviewing the potential impacts and risks during the Navitas ENVIID, emissions from a standalone incinerator were scoped out to prevent double counting with FIG emission impacts. Even should a temporary incinerator be required at the supply base in the event that the FIG facility is not yet available, this would be very short-term. Therefore the only source of emissions that could impact regional air quality are those that result from two LTV vessels at anchor in Berkeley Sound for a cumulative duration of 13 month with periodic visits to these LTVs from installation vessels. The impact of emissions from these are considered to be negligible and so following the ENVIID process described in Chapter 9, further assessment of these was scoped out. This is indicated in Tables 9.2 and 9.3. However, it is noted that all the line entries in Tables 9.1 to 9.3 that refer to combustion activities include an 'F'	

Reference	Request for information	Navitas response	Addressed
		under regional air quality indicating that the impact to air quality from offshore activities would be impact assessed. However, in the absence of any key receptors to changes in air quality offshore, this impact is scoped out and the ENVIID tables should state 'S' indicating that this has been scoped out. This change has been made within the post-consultation EIS and Chapter 10.9 continues to consider the global impacts of project associated emissions. Navitas has considered reinstating the inshore/onshore air quality chapter, however with minimal and very short-term sources of impact, the impacts are considered to be so low as to warrant remaining scoped out. The relevant tables have been updated in the post-consultation EIS. A definition of 'regional' will also be included.	
SAMS 3	Within Chapter 9 describing the ENVironmental Impact IDentification (ENVIID) workshops and identification of areas to be covered within the EIS, the terminology 'Screened out' is used when referring to whether impacts and risks should be excluded from the EIS. It is recommended that it may be better to adopt the terminology 'scoped out' instead	Thank you for your comment. This is noted and will be amended.	Chapter 9 and throughout whole document as necessary
SAMS 4	Whilst it is acknowledged that meaningful assessment of cumulative impacts is very hard to make, it is felt that more could have been done with this chapter considering the work undertaken in the EIS chapters. For example, colour coding the assessed residual risk for each receptor under each activity would give the reader an idea of cumulative risk.	Thank you for your comment. This is noted and a colour-coded assessment of cumulative impacts will be added to provide a better picture of cumulative impacts, although it is acknowledged this will be qualitative and likely very precautionary.	Chapter 13 Section 13.2
SAMS 5	Regional air quality: The assessment of impacts on 'regional air quality' from development activities are not fully explored in the EIS. More clarity is needed on what is considered to be 'regional', and a re-focus on how to assess activities and any associated impacts that may arise at that scale.	See comment SAMS 2 above.	Table 9.1 Table 9.2 Table 9.3

Reference	Request for information	Navitas response	Addressed
	Section 10.9 Atmospheric Emissions fails to explicitly mention regional impacts, despite being highlighted in Table 9.1 as the section in which impacts on this receptor will be assessed.		
SAMS 6	Seabirds: However, the overall synthesis of seabird distribution information needs improving as it is difficult to relate the levels of risk that are assigned throughout the assessment tables with the information presented in the descriptive ecology chapters given the data gaps that are present, and the different methodologies involved in the studies that are described.	Thank you for the comments - Navitas will review and improve. **Post-consultation response:** As per the note in Section 7.4.5.1, this was not considered to be feasible following review	Section 7.4.5
SAMS 7	Social: However, the depth of understanding of the data in relation to social impacts of the environmental effects is not equal to that of environmental impacts and the opportunity for significant analysis of data emerging from stakeholder consultations may have been overlooked.	A separate Socio-economic Impact Assessment is underway which will detail these more thoroughly.	N/A
SAMS 8	The major point of concern is the assumptions of offshore habitat conformity, and appropriately evidencing this assumption within the EIS itself. The reviewer feels that there could be more detail within the EIS on offshore benthic communities from different sampling stations, considering the repeated assumption of offshore habitat homogeneity. Whilst this maybe a fair conclusion from associated reports, this evidence is not clearly displayed within the EIS.	Navitas will add more detail here. Thank you for the comment.	References to survey report throughout the EIS and in Appendix 4
SAMS 9	However, the EMMP outlines the use of Remotely Operated Vehicle (ROV) surveys to visually identify habitats of conversation importance at the well locations (Section 15.6.2.1.5). Whilst this a standard method for marine surveys, it should be noted that this is limited to the observation of epifaunal taxa/communities and will not provide any data on the infaunal community of the benthic sediments.	Ninety stations were sampled using grabs, with drop-down cameras, in a previous survey (2012) carried out in the Sea Lion field. Analysis of these indicated a relatively homogenous infaunal environment such that visual ROV surveys of the well locations are considered sufficient to identify and habitats of conversation importance. Seabed grabs for sediment characterisation, benthos, chemistry and heavy metal analysis will take place post first drilling. Navitas will update the EMMP chapter in the post-consultation EIS in this regard.	Section 10.6.10.1 Section 15.6.2.1.1

Reference	Request for information	Navitas response	Addressed
SAMS 10	The calculation of the 'Permanent footprints' within Table 10.14 is not clear, although alteration of the figures is unlikely to change the resulting impact assessments.	The Table describes the impact of the moorings and anchors for the MODU and the FPSO. The MODU is temporary and so have no 'permanent' (until decommissioning) footprint. The FPSO temporary footprint includes a wider area of disturbance that will result from laying of the anchors initially (length 780 m on the seabed * 10 m disturbance corridor around the chain)*12). This is to account for physical impact of laying. The permanent footprint describes that resulting from the chain once settled on the seabed. Navitas will review the chapter and make changes to the text and tables where necessary in the post-consultation EIS.	Section 10.3.4.3
SAMS 11	No summaries are presented within the EIS to explicitly show that offshore environmental samples are indeed comparable (e.g., a table detailing univariate metrics such species numbers, total individuals, species diversity indices, dominant taxa identified etc.; alternatively figures showing similarity or cluster plots).	Thank you for this comment. Navitas has the supporting material and the documents can be supplied on request. Navitas made a conscious decision not to include this in the text as it would add to what is already considered a very large document.	N/A
SAMS 12	The offshore data is undoubtedly found within the supporting reports, but it feels like an omission not to include more evidence within the main body of this EIS, considering the assumptions made on habitat homogeneity.	Please see SAMS 11.	N/A
SAMS 13	There was little mention, however, of contingency planning for if a marine Non-Native Species was introduced by the operations detailed and a biosecurity management plan (BMP) for marine Non-Native Species should be developed. Whilst a BMP for marine species is indicated in the Non-Technical Summary on page 108, it is only mentioned in relation to terrestrial species in Table 1.9, and a marine BMP it is not mentioned	The Biosecurity Management Plan will cover both terrestrial and marine invasive species, this will be clarified in the relevant sections.	Section 10.12 Section 10.13

Reference	Request for information	Navitas response	Addressed
	explicitly within Chapter 10.12 as a tool to reduce impacts or mitigate risks in the body of the text.		
SAMS 14	The design of monitoring methods, however, should focus on increasing detection probability. Therefore, it is recommended that scrapes of biofouling present on artificial structures closely associated with the operations (e.g., Inshore Mooring Buoy) be included in the monitoring activities. Likewise, a combination of panels deployed for short periods (6-12 weeks) and longer periods (annual inspection) will ensure that late succession species are included in the overall species list whilst ensuring sufficient frequency of monitoring.	The proposed monitoring for marine invasives in described in Section 10.12.10.1 which includes: • The deployment of settlement plates in Stanley Harbour, Berkeley Sound and other appropriate locations, • The use of metagenomic technology to detect genetic material from non-native species in the environment (water samples), and • In the event that marine invasives are found, pathway analyses will be conducted to determine where / how invasives are being brought into the Islands. The EMMP Sections 15.6.2.1.4 and 15.7.2.2 describe the planned work. Of note, the proposed project does not require an inshore transfer mooring buoy and all reference to this has been removed from the EIS.	N/A
SAMS 15	Table 9.1 detailed that 'the introduction of marine invasive species to the offshore environment is not considered to be a concern over and above the introduction to inshore waters' and was thus screened out of the EIS. In the reviewer's opinion, this should have been screened in due to the potential transfer of marine invasive species between the FPSO and Berkeley Sound by vessels, particularly in the installation phase.	Thank you for the comment. The reason this was scoped out is that the environment around the Sea Lion field is highly dynamic and the likelihood of transfer/settlement is extremely low. The open ocean is not a suitable environment for the transfer and establishment of fouling species and the risk is further reduced by the duration the vessels are in proximity. The Conventional Trading Tankers will be at a distance of c200m on a hawser so transfer between these vessels and the FPSO is not possible.	Table 9.1

Reference	Request for information	Navitas response	Addressed
		Furthermore, all the vessels within Navitas' control will have clean hulls and anti-fouling paint. As a consequence of all these factors, the likelihood of transfer was considered low. The likelihood of establishment depends on suitable habitat and invasive species being in a reproductive state at the site.	
SAMS 16	The pathways for Marine Invasive Species introduction are under-represented in some of the summary tables examining pathways of impact from activities on the environment. For example, Figure 1-3 should include a tick under Marine Invasive Species Introduction next to (i) drilling operations and (ii) sub-sea works since specialised vessels required for this work could introduce marine invasive species to the area *via* hull fouling. In addition, add a tick for Marine Invasive Species under 'Human Population' since certain invasive species have been known to have an impact on human health and/or the economy where they have been introduced. Similarly, Table 2.2 should include a tick in the 'Drilling operations', 'Installation' and 'Offloading from FPSO to CTT' boxes for marine invasive species. In Table 1.7 the 'Risk of introducing marine invasive species' is only highlighted under the 'Biosecurity' label; however, there is also the possibility of a 'moderate' impact from introduced species on the 'benthos/habitats' category.	Navitas has committed to making sure all vessels undergo hull inspections and where necessary cleaning before they arrive. Navitas will amend the tables as appropriate. Thank you for the comment.	Chapter 1 Figure 1-3 Table 2.2
SAMS 17	Data predicting the probability of Non-Native Species introduction, establishment and spread is sparse, although a horizon scanning exercise was completed in 2019 and published in 2022 (Dawson *et al.,* 2022), which would be a good resource for this report. The data presented, however, was of good quality, although in certain sections the references were over a decade old and should be updated.	The references will be reviewed and Dawson 2022 will be included.	Section 10.12.4 Section 10.12.4.4
SAMS 18	There is a section on 'Coastal Sensitivity to Oil Spills' (Section 7.6, pg. 475), examining types of habitats and associated sensitivity to oil spills. A similar	Thank you for the comment Navitas will examine this to see whether it is appropriate.	Section 10.12 Section 10.12.4.4

Reference	Request for information	Navitas response	Addressed
	exercise can be undertaken looking at the risk of introducing marine invasive Non-Native Species - see Dawson *et al.* (2022).	Reference to Dawson *et al.* included. However, on review, it is felt this is an enormous task and requires extremely refined baseline data for all of the coastal areas, which means understanding their ecology, community structure not just in spatial but in temporal scales, which is not available. It is important to note that the coastal sensitivity analysis refers to coastal type in broad categories and so this analyses is not appropriate.	
SAMS 19	Whilst a variety of survey methodologies have been employed in the shallow marine environment, there is no mention of any settlement panel work or ROV surveys of any artificial structures in and around Berkeley Sound (although it was noted though that settlement panel work has been done over three years in Stanley Harbour at the Temporary Docking Facility; pg. 325). 'Sheltered artificial structures' were named as a habitat type in Neeley *et al.* (2010), but very little information has been given in the EIS, especially considering their importance for initial colonisation by Non-Native Species. For marine invasive Non-Native Species, these structures be the first place to monitor within the Sound.	Monitoring is planned, see Section 10.12.10.1 but, of note, there will be no permanent structures in Berkeley Sound associated with the development.	N/A
SAMS 20	It was noted that plankton surveys have not carried out by Navitas for this report, and that the literature reviewed is mostly over a decade old.	Yes this is correct. There is some recent work that has just been published. Navitas will update the text with this. There is also some one going work by a PhD student but the work is not at a stage in which it can be cited.	Section 7.4.1.3.1
SAMS 21	Key assumptions made regarding the risk posed by different vessels are appropriate, although the origin of the vessels that will potentially be visiting the Sound was vague.	The origin of the vessels that will visit Berkeley Sound is still to be confirmed. These vessels are subject to a future competitive tender. Educated assumptions (based on where the majority of Owners and similar activity areas are) have been made as to their	N/A

Reference	Request for information	Navitas response	Addressed
		expected origin at this stage. All vessels will be subject to stringent vetting process.	
SAMS 22	It is stated in Section 3.2.18.1, pg. 108 that "Biosecurity Management Plan: Provides a framework for the processes intended to reduce the likelihood of introducing terrestrial or marine non-native species, which may then become invasive to the ecosystem of the Falkland Islands". This statement does include terrestrial and marine Non-Native Species in the BMP, but throughout the remainder of the EIS document the BMP is just related to terrestrial Non-Native Species (e.g., Section 1.7.4.2.8, pg. 55). Clarity is required whether the BMP relates to both terrestrial AND marine and if it is just for the former, then a marine BMP should also be included.	The Biosecurity Management Plan will cover both terrestrial and marine invasive species, this will be clarified in the relevant sections.	Sections 10.12.5, 10.12.5.3, 10.12.10, 10.13.5.1, 10.13.10.1, 15.3, 15.4, 15.7.2
SAMS 23	Furthermore, under 'Potential Management Options' from marine invasive species in Section 15.6.2.1.4 there are no mentions of any control/eradication measures, with text focusing on prevention of another introduction event. This weakness is also replicated in Section 15.7.2.2 Marine Invasives, with no mention of potential management options. Table 1.9, pg. 68 states that "Settlement plates and pathways analysis [will be conducted] in the event of any incursions" – Settlement plates and pathway analysis should be implemented as part of the routine marine Non-Native invasive species monitoring programme, not just in the event of any incursions/introductions.	Thank you for your comment. As part of the 'Proposed Survey Activities' listed in Section 15.6.2 in the summary EMMP chapter, Section 15.6.2.1.4 states the following Management Objective: 'Confirm that presence of non-native species is not increased beyond levels of background change.' The associated action is to place settlement plates in the vicinity of the LTVs in Berkeley Sound, and on the TDF, prior to activity commencing with a view to providing early detection of the settling of any non-native species that may result from ballast water exchange or bio-fouling. In the event that a new marine invasive species is discovered, a pathway analysis will be conducted to attempt to determine where / how the species had been brought into the Islands, at which time and Navitas will review all Potential Management Actions. Of note, the table in Section 15.6.2.1.4 lists the	Section 15.6.2.1.6 Section 15.7.2

Reference	Request for information	Navitas response	Addressed
		relevant 'Adaptive Management Thresholds' and the Potential Management Actions'. Under the 'Post-Sanction and Pre-First-Oil' section of the proposed 'Research and Studies' (Section 15.7), Section 15.7.2.2 includes the following Scope of Work: 'In the event marine invasives are discovered in the course of normal monitoring, pathways analysis will be conducted to determine where / how invasives are being brought into the Islands'. These ensure that monitoring will be conducted pre-First-Oil and throughout the life of the development (Table 15.7) to ensure the early detection of any non-native species. If detected and identified through genetic analysis, subsequent pathway analysis will provide likely origin. The origin and history of Navitas chartered vessels will be known. However, it is correct that no eradication measures would be undertaken by Navitas as these are notoriously difficult and ineffective for marine spp. The focus with regard to managing the risk of invasive species is indeed on prevention of occurrence. Such measures include, for example, the application of D3 ballast water management plans with a D2 level of ballast water treatment for all vessels (Section 10.12.7.1) and hull inspections of LTV's prior to entry into Berkeley Sound. That said, if obvious invasive non native species were detected then Navitas would commission cleaning/removal should it be safe to do	

Reference	Request for information	Navitas response	Addressed
		so. A Biosecurity Plan will be prepared prior to the commencement of operations. All invasive species management protocols will be reviewed and any introduction detected will be communicated to FIG.	
SAMS 24	Related to the above, there is no consideration of total Non-Native Species 'waste' to be disposed of at landfill (i.e., within Table 5.30) if they are detected on the FPSO platform and have to be removed.	The FPSO will be dry-docked for its refit and anti-fouling paint will be applied to the hull prior to its departure for the Falkland Islands to prevent fouling of the steel by marine growth. Management of waste arising from any invasive species detected will be described within the Biosecurity Management Plan but ultimately, all disposal methods would be agreed with FIG in the event they were needed.	N/A
SAMS 25	Direct off-setting (Table 8.9) was not considered possible, but the reviewer would suggest that other indirect off-setting (control/eradication of a potentially high risk invasive marine Non-Native Species) is costed and included in the Internal Carbon and Biodiversity Offsetting Fund (Section 8.11.3).	Navitas notes this comment. Indirect offsetting *via* the control or eradication of marine or terrestrial invasives may be candidate projects that are considered under the offsetting fund in due course. Public Consultation EIS Section 8.11.2.2 'Indirect Offsetting' says 'Navitas is also committed to exploring indirect offsetting opportunities locally. These may include habitat restoration projects, pest and invasive species eradication/control and conservation, biodiversity educational initiatives and the research required to inform them.'	N/A
SAMS 26	Within the impact assessment chapters, the linkages between Designated Sites and the potential impacts on their constituent features are not fully drawn out... To avoid such amplification of risk, it is perhaps something that	Thank you for your comment. This is noted and Section 13 has been revised to colour-code each receptor and assessment to give an overview of the	Chapter 13

Reference	Request for information	Navitas response	Addressed
	could be addressed more thoroughly within Chapter 13 of the EIS. For example, a table detailing species a, b, & c have been identified as potentially at risk from the development, which in turn will impact on the status of Designated Areas x, y, & z.	impact interactions. Navitas has also added where a designated site or species may be affected.	
SAMS 27	Table 9.1 shows that Designated Sites have not been considered as receptors when constituent features (e.g., seabirds) are assessed as being potentially impacted. If population level impacts occur to bird species for which protected areas are designated, the integrity of the Designated Site will also be under threat. Designated Sites have only been identified as a receptor for seabed disturbance in Berkeley Sound, waster generation, introduction of terrestrial invasive species, and under Oil Spill scenarios. This omission is best demonstrated with an example. In Chapter 10.1, examining the impact of artificial light, the EIS assesses the potential impact on 'The colony of the IUCN 'Near Threatened' sooty shearwaters on Kidney Island' (pg. 604). Kidney Island is a designated as Natural Nature Reserve (NNR) and as an Important Bird Area (IBA), likely due to the sooty shearwaters amongst other birds; thus any impact on this population would arguably impact the integrity and status of this site as a NNR and IBA.	Thank you for your comment. This is noted and Section 13 has been revised to colour-code each receptor and assessment to give an overview of the impact interactions. Navitas has also added where a designated site or species may be affected.	Chapter 13
SAMS 28	Although Section 7.5.2.3.3 reports only two sites being put forward for consideration as new Ramsar Sites. There are currently 18 proposed Ramsar Sites within the Falkland Island	Navitas will revise as appropriate. Thank you for the comment.	Section 7.5.2.3.3
SAMS 29	A strong precautionary approach would be to assume that the 18 proposed Ramsar sites as 'designated' when assessing the environmental landscape of the area, in addition to any other 'in progress' protected areas.	See SAMS 28.	N/A
SAMS 30	For fish there is emphasis on commercial species although non-commercial species are also mentioned. While this is understandable because much of the baseline data derives from fisheries surveys, in a few areas it skews the writing perhaps giving the impression that non-commercial species are of less importance – even though they may have important ecological functions. For example, on pg. 596 when discussing the effects of light,	Thank you for this Navitas will updated and amend. Much of the data came from Arkhipkin *et al.* (2012) which also contains important species that are not targeted. See Arkhipkin, A., Brickle, P., Laptikhovsky, V. V., Pompert, J. & Winter, A. (2012). Skate assemblage on the eastern Patagonian shelf and	Section 7.4.4

Reference	Request for information	Navitas response	Addressed
	information is repeated from an earlier section which focuses on commercial species. This repetition is not really needed because this section should be discussing the known effects of light on squid and fish, rather than just repeating which species are found in the area.	slope: structure, diversity and abundance. Journal of Fish Biology 80, 1704–1726.	
SAMS 31	Uncertainties have been acknowledged in the report. This leads to a confidence evaluation for some of the risks. It feels perhaps some of these have been over cautious. For example, on pg. 1179 the impact of a spill during offshore transport on toxic effects on plankton, squid and fish is evaluated as 'very low' but with 'Uncertain' confidence. Yet the supporting evidence argues rather strongly that there has been experimental testing of oils from this site using zebra fish as a model and that quite a lot is known about toxicity of crudes to fish at least (Section 12.1.4.2.3).	Thank you for the comment. The uncertainty remains because zebra fish are an analogous species.	N/A
SAMS 32	The impact of the emissions on global issues such as global warming and oceanic water quality (via Ocean Acidification) have been reasonably considered, however, the background literature presented should be updated to include up to date literature, particularly in the area of ocean acidification. Two key pieces of literature that could be useful in this section include Watson (2020) and Shaw *et al.* (2023).	Thank you for your comment. This is noted and will be amended.	Section 10.9.4.2
SAMS 33	It is slightly disappointing not to have more information presented on possible issues that drilling and spills may have on green and red species, as the EIS only really presents potentially impacts and mitigations linked to brown species of macroalgae (albeit limited mainly to kelps and not to other intertidal species of brown macroalgae). There is also a need to recognise that structures put in the water for oil drilling offer a potential new habitat for marine species including seaweed.	Thank you for the comment. The taxonomic status of many of our seaweeds, in terms of understanding, is a work in progress. There is a draft report that is cited in the report. Brodie, J. & Mrowicki, R. 2019. A draft checklist of the seaweeds of the Falkland Islands. Natural History Museum, London. 31 July, 2019. Navitas will update the text regarding the offshore structures as potential new habitat for seaweeds. They identified 253 taxa from two surveys. Gaps remain in distribution and abundance.	Section 10.3.4.2.1.3

Reference	Request for information	Navitas response	Addressed
SAMS 34	The methodology used for macroalgal species is only on kelp species and misses, as highlighted in Table 12.20, that there may be a species related response to oil spills.	Thank you for your comment. This is noted and acknowledged. There this little known about the phycology of the Falkland Islands. Kelp was chosen as it is a key species to ecosystem function in the Falkland Islands.	N/A
SAMS 35	Table 12.27 contains a summary of risks for oil spill scenarios, and highlights that the toxic effects for kelp are likely to be moderate with a low initial risk. Mitigation aspects have been highlighted, but there is uncertainty around the confidence of this event/risk occurring. However, this only covers kelp species, and nothing is presented that links to the seaweed ecosystem as a whole.	Thank you for the comment. The confidence is uncertain as the impact of oil on Falklands kelp species specifically were not tested. Analogues from the Northern Hemisphere were tested. Navitas did not assess other groups as very little is known about the taxonomy and therefore abundance and distribution. Navitas will update the text in the document to reflect this.	Section 12.2.4.2.1
SAMS 36	Within the EIS, only data for kelp has been discussed. There are other macroalgal species present and as highlighted in Liu *et al.* (2019), oil spills can cause stress to *Ulva pertusa*. Other research also suggests a shift in seaweed/macroalgal assemblies/populations after an oil spill, which is important to consider when evaluating the risks and mitigations linked to the potential toxic effects of an oil spill.	Thank you for the comment. Navitas will update the text accordingly.	Section 12.2.4.2.1
SAMS 37	There is lack of information on potential risks to green and red species of macroalgae. Most of any discussion around associated risks is linked solely to kelp beds and two main brown seaweed species. Considering there are around the 253 species presented in the Falkland Islands as a whole, this presents a large gap	Thank you for the comment. This should be 253 taxa (not species) and will be updated. This is what has been identified by phycologists on a recent project (Brodie and Mrowicki. 2019). However, their distribution and abundance are not known. See also SAMS 33. Brodie, J. & Mrowicki, R. 2019. A draft check-list of the seaweeds of the Falkland Islands. Natural History Museum, London. 31 July, 2019.	Section 7.4.2

Reference	Request for information	Navitas response	Addressed
SAMS 38	In the event of an oil spill, there is likely to be a shift in intertidal populations as highlighted by Zhou *et al.* (2019), with responses dependant on whether a species is tolerant, opportunistic or an equilibrium type.	Thank you for the comment. Navitas will update the text accordingly.	Section 12.1.4.2.6 Section 12.2.4.2.5
SAMS 39	Described insufficiencies have arguably influenced some of the impact assessments, especially the omission of updated literature on underwater noise impacts of Mobile Offshore Drilling Units (MODU) and some vessel types, as well as the increased knowledge about sei whales around the Falkland Islands should be integrated more in certain sections of the report.	Thank you for the comment. Whilst Navitas has been precautionary in the assessment for underwater noise there are other new developments in noise modelling and Navitas will update these sections with new noise modelling and also update the relevant chapters. See also FIFD 54.	Section 10.4 Section 10.5
SAMS 40	Particular attention should be made with respect to the addition of literature published on the different species in the region over the past 10 years, as currently most citations within the report provide information up to 2013 only. Suggestions include Baines & Weir (2020), Franchini *et al.* (2020) Weir & Stanworth, (2020), Weir *et al.* (2021) and Cerchio & Weir, (2022), but also see specific recommendations in the sections below.	Thank you for the comment - Franchini *et al.* (2020); Weir and Stanworth (2020) will be updated. The other references are cited.	Section 7.4.6
SAMS 41	With respects to mitigation and monitoring for underwater noise (e.g., Section 10.5.10.1 & Chapter 15) it should be laid out in more detail how acoustic monitoring will be carried out to decrease uncertainty in operational noise levels and potential impacts on marine mammals. It would be good to elaborate on the 'hydrophone recordings' that will be used to validate noise levels, i.e., how many recorders will be used at what distances to the sources, and how will be deployed. Anchored static systems would be best for the task and all recordings should follow international standards for monitoring of underwater noise (e.g., Hannay *et al.,* 2023; Ainslie *et al.,* 2022).	Chapter 15 provides indicative EMMP summary tables and the EMMP workshop report proposes that an advisory committee including individuals with relevant expertise in the subjects being monitored will help draw up the specifications in any scope of work...and would also be able to comment on the results of the monitoring.' Therefore, levels of detail such as the number of hydrophones etc. are yet to be agreed. In the post-consultation EIS Navitas will state in Ch 15, and 10.4/5 if necessary, that details on monitoring will be developed with the advisory committee, and ensure the timing for this (post sanction) is clear.	Section 15.6.2.1.3

Reference	Request for information	Navitas response	Addressed
SAMS 42	The scope of work of noise monitoring (Section 15.6.2.1.1) should include a more comprehensive assessments of noise levels at various distances and potential impacts on cetaceans from acoustics – only monitoring noise levels near the operations is not going to fill the existing data gaps. A design using moorings or landers at different distances from the working area would provide a good dataset for future assessments (see Martin *et al.* (2023) for an example array design). Noise assessments and acoustic surveys for marine mammals can easily be aligned and provide valuable data for future assessments and to reduce uncertainty re impacts on marine mammals.	The EMMP (section 15) gives an outline of monitoring to be undertaken and a full work up of the noise monitoring programme will be developed post-sanction. See also response to SAMS 41 regarding timing for the development of detailed specifications and scopes of work for monitoring. Thank you for the Martin *et al.,* reference. The noise monitoring programme may also been informed by the updated noise modelling that will be included in the post-consultation EIS.	Section 15.6.2.1.3
SAMS 43	Monitoring for underwater noise is intended to be undertaken by Seabird and Marine Mammal Observers (SMMOs) on board specific vessels. These should be supported by Passive Acoustic Monitors (PAM) (e.g., towed hydrophone or fixed archival for impact assessment and collection of baseline data); real-time PAM buoys should also be considered for mitigating impacts especially during construction/decommissioning. Monitoring of marine mammal responses to various stages of the project at different distances, using PAM landers, should also be undertaken to reduce uncertainties in some of the cited assessment parameters (Section 10.4.10.1).	Please refer to SAMS 41. Navitas will consider the use of PAM in consultation with the EMMP advisory group. Navitas will update the post-consultation EIS to include this clarification.	Section 10.4.10.1 Section 15.6.2.1.3
SAMS 44	The investigation of low noise thrusters is welcomed (Section 15.7.2.3) but a stronger commitment to using noise reducing technologies with respect to propellers and other solutions for future vessels could be made, given the risk of continuous noise from on-site Dynamic Positing (DP) vessels to noise-sensitive species.	Vessels will be dry docked in accordance with their classification requirements. Hulls and propellers will be cleaned accordingly. Engines shall be maintained similarly and DP will be used only when necessary. All these actions will minimise underwater noise from all vessels. Navitas will update the post-consultation EIS to include this clarification.	Section 10.4.10.1 Section 15.7.3
SAMS 45	For example, there are data on sei whale acoustics from the South Atlantic now available (e.g., Cerchio & Weir, 2022) that should be included (pg. 423). Similarly, update is recommended for Antarctic minke whales (pg. 423),	**Initial consultation response:** Thank you, these references will be reviewed and included.	N/A

Reference	Request for information	Navitas response	Addressed
	which have been described since 2014 (Risch *et al.,* 2014) and numerous publications from the South Atlantic have followed since. The species-specific review in Section 7.4.6.3.1.6 appears to omit description of available acoustic data. It would be good to cite the actual ambient noise levels recorded by Hipsey *et al.* (2013) rather than just giving a qualitative description. Re-analysis of the existing (and new) acoustic data should be recommended especially regarding Antarctic minke and sei whales. There is further information (e.g., Clark & Gagnon 2022) available for other species on the range of sound emitted by cetaceans that it would be advisable to include within Table 10.22.	**Post-consultation comment:** This table was removed from Section 10.4 during the chapter revision as the data were not actively used in the assessment. Therefore, these suggested changes are no longer relevant.	
SAMS 46	Summary tables for marine mammals (e.g., Tables 7.28 & 7.32) would be enhanced by including citations for each statement 'Behaviour' column. The content of Behaviour column should be also reviewed as it is a mixture of behaviour and distribution related comments; the relevance is unclear. It may be advisable to use categories, i.e., foraging, migration, distribution etc. for each species and fill in known facts about the South Atlantic populations of this species and/or global populations if data from the South Atlantic is missing.	Thank you for the comment. This will be taken into consideration.	Table 7.28 Table 7.32
SAMS 47	The review of potential oil spill consequences on cetaceans (Section 12.1.4.2.5.2) should be updated with the latest literature, particularly lessons learned from the deepwater horizon spill (e.g., Frasier *et al.,* 2020; Schwacke *et al.,* 2022; Marques *et al.,* 2023). In addition, the statement that there is no indication that marine mammals associate with oil rigs (Table 12.13) has been shown to be untrue - see for example Delefosse *et al.* (2020) and Todd *et al.* (2024).	Thank you for the comments - Navitas will update this section.	Section 12.1.4.2.5.2
SAMS 48	Some assumptions on underwater noise and source signals could be updated with newer literature (see comments below on MODU signal assessment) and newer vessel literature/databases e.g., the Joint Monitoring Programme for Ambient Noise North Sea (JOMOPANS) and	Thank you for your comment, the underwater noise modelling is currently being re-run to more accurately reflect Navitas' proposal for the Sea Lion field and Berkeley Sound. The underwater noise sections (10.4 and 10.5) are also being updated with relevant	Section 10.4 Section 10.5

Reference	Request for information	Navitas response	Addressed
	Enhancing Cetacean Habitat and Observation (ECHO) project databases on vessel noise.	citations suggested during the public consultation. Please also refer to FIFD 54.	
SAMS 49	There appears to be a general underestimate of when potential impacts from underwater noise should be considered. For example, underwater noise is not considered during installation (e.g., Table 2.2), but anytime there are vessels on site for extended periods, the issue of noise pollution and potential for behavioural responses/stress on receptors should be considered. In addition, recent studies (Martin *et al.,* 2023) has demonstrated impacts from the USBL signals used for positioning during MODU operations on marine mammals. These signals (at 25-27 kHz) and their potential effects, especially for odontocetes, should be considered within the EIS (e.g., within Table 10.26, Section 10.4.2.1 & Section 10.4.8).	Thank you for your comment, the underwater noise modelling is currently being re-run to more accurately reflect Navitas' proposal for the Sea Lion field and Berkeley Sound. The underwater noise sections (10.4 and 10.5) are also being updated with relevant citations suggested during the public consultation. Please also refer to FIFD 54.	Section 10.4 Section 10.5 Table 2.2 Table 10.21
SAMS 50	Marine mammals might also be disturbed from impulsive, shorter term noise during drilling and construction phases of the project (Table 8.9), with concerns including behavioural responses and injury. This should be highlighted and explained better throughout the EIS. Possibilities regarding mitigation and offsetting should also be described more comprehensively and the relevant literature be cited (e.g., Martin *et al.,* 2023; and many more).	Please note that there is no source of impulsive sound in the proposed project. Thank you for your comment, the underwater noise modelling is currently being re-run to more accurately reflect Navitas' proposal for the Sea Lion field and Berkeley Sound. The underwater noise sections (10.4 and 10.5) are also being updated with relevant citations suggested during the public consultation. Please also see FIFD 54. Navitas has been unable to identify any offsetting possibilities in the literature cited. Please note that Table 8.9 does not indicate that there is no impact, only that identifying a realistic and effective direct offsetting project for this impact has not been possible.	Table 8.9 Section 10.4.2
SAMS 51	Continuous vessel presence offshore will create underwater noise which might impact marine mammals and other noise sensitive species and should	This is covered in Sections 10.4 and 10.5. Table 9.1 will be reviewed and checked.	Section 10.4 Section 10.5 Table 9.1

Reference	Request for information	Navitas response	Addressed
	be further assessed. This is similar for the presence of Large Transport Vessels (LTVs) in Berkeley Sound (Table 9.1, pgs. 565 & 569).		Table 9.2
SAMS 52	The EIS states that underwater noise impacts on marine mammals are most likely (Section 1.7.4.2.2). However, possible impacts on other parts of the ecosystem including seabirds, plankton, fish and benthic invertebrates can also be expected. There is growing evidence and several reviews published that show the impact underwater noise can have on the whole ecosystem, so this statement should be rephrased to not downplay effects on other species.	The underwater noise modelling is currently being re-run to more accurately reflect Navitas' proposal for the Sea Lion field and Berkeley Sound. The underwater noise sections (10.4 and 10.5) are also being updated with relevant citations suggested during the public consultation. Please also refer to FIFD 54.	Section 1.8.4.2.2
SAMS 53	The literature on marine litter and impacts on seabirds and cetaceans need to be considered more throughout the document, especially to literature from the last ten years (2015-2024) Examples include the study by Padula *et al.* (2023) on debris impacts on odontocetes in the SW Atlantic, and Phillips & Waluda (2020) on seabirds and debris impact.	Thank you - Navitas will update this section.	Section 10.10.4.1.2.1
SAMS 54	Although page 795 states that "… impacts to air quality have been screened out owing to distance of the offshore location from environmental and social receptors…", this statement is inconsistent with the presentation of scoping of activities and receptors within Chapter 9.	See comment SAMS 2 above.	N/A
SAMS 55	Further clarification on the distinction between 'Regional' and 'Global' air quality is recommended. This definition should be noted in the EIS and then put into practice throughout the document. Even if the impact regionally is considered insignificant, this needs to be documented within the report.	Thank you for your comment. This is noted and will be addressed in the narrative.	Table 9.1
SAMS 56	The outcomes of ENVIID workshop clearly demonstrate that concerns existed over how regional air quality could be impacted by the activities associated with the proposed development. However, assessments explicitly related to regional air quality have not been drawn out in the impact assessment chapters. The reviewer wonders whether the lack of a clear definition of what is regarded as 'regional' versus 'global' is a reason why this omission exists, and is perhaps indicative of a flaw in the methodological approach. More clarity is needed on what is considered to	See comment SAMS 2 above.	N/A

Reference	Request for information	Navitas response	Addressed
	be 'regional', and a re-focus on how to assess activities and any associated impacts that may arise at that scale.		
SAMS 57	Although it is accepted that DREAM/ParTrack has a history use within the Oil & Gas sector (Section 10.6.4.3.1) for use in particle dispersion modelling, many other more recently developed an updated particle tracking models are available (e.g., MIKE, Delft). It would be interesting to see whether the model results produced by DREAM/ParTrack are validated by alternative models, as it would add confidence to the predictions and assessments made.	PW modelling will be redone after PW is produced (section 15.7.3.1), an update particle tracking model such as those suggested can be used to corroborate the DREAM/ParTrack model and to refresh the model with real PW data. Text will be amended in this section to reflect that an alternative model may be used.	Section 10.7.5 Section 15.7.4
SAMS 58	Seabird survey coverage within the drilling campaign area is not present during April, May and September (noted in Section 7.4.5.2.1.1). Whilst attempts have been made to overcome this through the Gap Analysis Programme (GAP) (Section 7.4.5.2.1.4), this study was restricted to a number of larger species that tracking devices could be deployed on. The report acknowledges this; however, it is not clear how this shortcoming is incorporated during the risk assessment process.	Thank you for the comment. This is an acknowledged gap and Navitas has applied the precautionary principle and a confidence rating to the assessment. Navitas are committed to filling this gap with SMMOs deployed on vessels for three years pre First-Oil.	N/A
SAMS 59	'Seabird vulnerability to oil spill' (Section 7.4.5.6) relies on data from White *et al.* (2001; 2002), which as previously noted is more than 20 years old. It would be desirable to try and update this classification using more recent data collected during the GAP project, and from other sightings surveys that are noted in the document.	Navitas recognise that the data is old. As noted in the EMMP workshop report (2019): 'The workshop agreed that it would be useful to collect further data opportunistically from vessels associated with Sea Lion development, but that a wider data collection effort to update seabird information was beyond the scope of the EMMP.' Update to the seabird vulnerability to oil spill atlas can only be updated with a broader area wide at sea data collection effort which would require an FIG and multi-industry collaboration and investment.	N/A
SAMS 60	Data sources for the EIA appear relatively sound and comprehensive. Overall, the quality of the data presented is very good. The type and level of	Thank you for your comment. This is noted and Navitas has commissioned a separate Socio-Economic	N/A

Reference	Request for information	Navitas response	Addressed
	risk for environmental factors appears to have been well assessed, but the social impacts of these, where not as readily quantifiable, were more weakly presented. The EIA would benefit from improved analysis of the social impacts.	Impact Assessment which will analyse the social impacts in more detail.	
SAMS 61	Particular attention is drawn to the identification of shipping routes (Section 11.1) and the associated risk assessment which were conducted well, as much of this assessment was informed by vessel Automated Identification System (AIS) data and collision risk modelling that is widely used. Stakeholders within FIG and from the fishing industry were consulted three times over the evolution of the project, yet data from these consultations is minimally represented in this chapter as part of the confidence assessment. Again, in Section 11.2, stakeholder opinions gathered through the consultations were summarised briefly (11.2.4.4.1.3), but it is unclear how many vessel Captains/owners were consulted.	Local fishing companies (who are in some cases vessel owners) and vessel agents have been consulted throughout the evolution of the Sea Lion project. The nature of the Falklands fishing industry is such that ship's captains are not particularly accessible (they spend limited, if any time onshore, and often do not speak English). Navitas will seek to include more detail on the consultation and industry responses into Section 11.2.4.3 and all other relevant sub-sections on stakeholder input.	Section 11.2.4.3
SAMS 62	There are some inaccuracies in statements and the use of literature in some cases could be elaborated on. Some of the cited literature is 20 years old, and there may be more recent studies with applicable data available for consideration.	Thank you for the comment. Navitas will review and update literature in the post-consultation EIS.	All
SAMS 63	The cumulative effect of PW discharges including traces of oil, Polycyclic Aromatic Hydrocarbons (PAHs) and chemicals could be more specific, and using more up-to-date literature to describe the impact should be considered. Similarly, except for chemical characteristics, it is important to include loading (concentration x volume) (see Gagnon *et al.,* 2011). No effect on combined factors is discussed, for example temperature and hypersalinity, which may have wider consequences on ecosystems (e.g., Smyth & Elliott, 2016); possible effect on pH is not discussed either.	Thank you for the comment. At the time of writing, dosages and quantities of chemicals that will used will be further defined pre-operations and will be submitted to FIG for pre-approval. Although, as stated in ED 118 (and numerous other comments), all chemicals will be selected from the OCNS ranked listing to minimise environmental impact. Further, the PW will be monitored in line with the RBA as described in Section 10.7.1.1.1.2 and 15.7.3.1. Nonetheless, the section will be updated with further literature review.	Section 10.7.4.2.2 Section 10.7.5 Section 15.7.4

Reference	Request for information	Navitas response	Addressed
SAMS 64	'Disturbance to seabed', 'Oil spill – offshore' and 'Fuel Oil spill – inshore' are not directly considered as activities that may have an impact on water quality (see Table 1.7). Whilst the presence of oil within water and associated impact on other receptors is considered within Chapter 12, the impact on water quality is not explicitly highlighted. Disturbance to the seabed may led to resuspension and dispersion of pollutants and materials that would otherwise be settled on the seafloor	Thank you for the comment. All summary tables will be reviewed and amended as necessary.	Table 1.8
SAMS 65	Examination of Figure 12-39 reveals that more than 50% of oil from a bunkering spill leaves the model domain after six days, which is a substantial portion of the pollutant to lose from the model and still be confident of predictions of end behaviour. A larger domain would likely be more appropriate to better understand the behaviour of Marine Gas Oil (MGO) after such a spill.	As stated in Section 12.1.4.3.4.1: 'Model results are collated and reported *via* a 3D grid, and for each scenario the grid layout has been chosen that maximises the accuracy of the outputs by focusing on the area occupied by the vast majority of oil particles for the period when they are most likely to present significant environmental impacts.' Owing to the volatility of MGO and the highly dynamic environment at the Sea Lion location regarding wind and wave action, the grid size is selected to demonstrate the worst-case outcome of the MGO spill. Section 12.1.4.8.1 states, 'the surface MGO is expected to decline very quickly, as it gets dispersed by wave action, and also evaporates and biodegrades. The model predicts that after 2 days from discharge, no MGO will remain on the surface. By 4 days, 31% will have evaporated, 25% will have biodegraded, and the remainder of the discharge will either be dispersed in the water column or dissolved. The MGO also starts to exit the modelling grid at 4 days, and the trend of the dispersed oil being degraded continues in	Section 12.1.4.8.1

Reference	Request for information	Navitas response	Addressed
		the water column beyond this point, no MGO is predicted in sediments.'	
SAMS 66	Within Section 7.3.3.3 it is unclear whether the current speeds presented for the Sea Lion Field result from actual measurements from contracted survey work, or if the information is based on published data from other sources.	This data came from BMT Argoss. 2015. Sea Lion Hydrodynamic Modelling – Final Report. Reference Number: A14043_Final_Report_r1. Prepared for Premier Oil Exploration and Production Limited and the reference will be added.	Section 7.3.3.3
SAMS 67	The presence of Naturally Occurring Radioactive Materials (NORM) within PW is discussed in Section 10.7.4.1.2.1, although there are some inaccuracies. The statement about gamma radiation is incorrect, as not all radionuclides emit gamma rays. Indeed, the two described radionuclides, 226Ra and 228Ra, are α and β- emitters respectively. The activity of these radionuclides can be, however, estimated *via* their gamma emitting parents or daughters when aiming at the particular energy peaks of the gamma spectrum. There is no information on any existing data pertaining to the radioactivity of the ground water, and a lack of information about possible impacts. This section needs an update as it has been shown that radioactivity in the environment may be elevated due to discharges of PW (e.g., Eriksen *et al.,* 2006; Ahmed *et al.,* 2021).	Thank you for your comment. This is noted and the text will be amended with updated references for clarity. NORM build up typically takes time and only becomes a concern when Produced Water (PW) breakthrough occurs. The base case is to reinject the produced water (PWRI).	Section 10.7.4.1.2.1 (NORM)
SAMS 68	Within Section 10.10.2.2.1 it states that 'some oily wastewater from the onshore mud plant' may go to sewer under consent, or alternatively be sent offshore for processing. It is not clear whether this has been taken into account in the figures used, although suspected to be a minimum quantity comparatively as thus likely accommodated within the assessments made.	Onshore oily waste water will not go into the Stanley sewerage system unless under consent from FIG. Onshore operations which may result in oily water discharge will be completed in a bunded area which will contain the oily water, this will then be treated, incinerated or dealt with away from the sewerage network and shall align with Navitas' Waste Management Procedure. This will be clarified in the post-consultation EIS.	Section 10.10.2.2.1 Table 10.86

Reference	Request for information	Navitas response	Addressed
SAMS 69	Section 10.7.4.1.5 discusses the discharge of hypersaline water from vessels, using Roberts *et al.* (2010) as a primary source. This study is based on nearshore, shallow water environments. An example of more up to date literature is Dewar *et al.* (2022), which describes plumes of hypersaline water in open ocean environments, and thus arguably could help inform this section further. It is unclear if the second paragraph in this section still refers to Roberts *et al.* (2010) or to an experience with such plumes from the past. Turbidity impacts due to hypersaline discharges are omitted from this section. Similarly in Sections 10.7.4.2.5 & 10.7.4.3.1 only Roberts *et al.* (2010) is cited, while more relevant and up to date literature may be available and would add value to the assessments made.	Thank you for your comment. This is noted and the subject matter will be reviewed and the narrative updated where necessary.	Section 10.7.4.1.5 Sections 10.7.4.2.5 Section 10.7.6.1.5
SAMS 70	• Species scientific names are not always italicised and need some attention. Examples include Patagonotothen ramsayi & T. gaudichaudii on pg. 294; P. brevicauda on pg. 339; D. gahi on pg. 340; Allothunnus fallais in Collette reference on pg. 1315. • Figure 1-1, pg. 29. The text within the figure is small and of low resolution, making it difficult to read. • Section 7.2.2, pg. 246. Typographic error, with a space missing – 'Figure 7-4and Figure 7-5' • Figure 7-22, pg. 272. The size and resolution of the Figure means that the data (wind vectors) is not easily readable. • Section 7.3.7.1.2.1, pg. 279. Units for PAH concentrations are given as 10 µg/g-1; this should be either µg/g or µg -1. Comparing this section to section 7.3.7.2.2 shows units written as µg.g-1 – for consistency, it may be worth revisiting how units are expressed across the whole document. • Table 7.2, pg. 289. There is no indication of the units for the metal concentrations provided within the table; presumably these are all µg.g-1. • Section 7.4.1.2.1, pg. 292. Typographic error in the 4th paragraph, there are two spaces between 'community' and 'shows'. • Figure 7-41, pg. 314. Typographic error in the legend for the Figure, which	Thank you for your comment. This is noted and will be amended.	General correction of typos listed

Reference	Request for information	Navitas response	Addressed
	reads 'intertidal habit map…'; this should be 'habitat'. • Table 7.8, pg. 328. The entry for 'Offshore benthic flora & fauna' in the 'NFB and the Sea Lion Field' contains text related to Berkely Sound, not the NFB/Sea Lion field. • Section 7.4.4.3.1.1, pg. 339. The last paragraph cites Brickle (2005); within the reference list there is Brickle *et al.* (2005a) or (2005b), and Brickle *et al.* (2005) (pg. 1311). It is assumed that the in-text citation should be Brickle *et al.* (2005c), and the last reference should be amended. • Section 7.4.6.1, pg. 413. There seems to be an omission - baleen whales may also feed on small schooling fish, not just plankton. • Section 10.1.6.1.1, pg. 603. The text states there are 'negligible numbers of any species of geographical importance'. This is written in quotes, and thus implies that it has been taken from some other paper or report, but no source is given. • Section 10.4.1.1, pg. 655. Marine Strategy Framework Directive (MSFD) regulations should be included within the relevant legislation for underwater noise impact assessments. • Section 10.4.4.3.1, pg. 663. In text citation is written as CeliMonica *et al.,* 2015; the reference list details Celi *et al.,* 2015. • Figure 10-27, pg. 729. The Figure legend states "Total environmental risk to the sediment at the NA-P-01 DC at end of drilling, 5, 10 and 20 years after drilling"; however, there are only panels provided to show 'end of drilling' and '20 years after drilling' – the 5, 10 & 20 years are absent. • Figure 10-30, pg. 768 & Figure 10-31, pg. 769. Both Figures have very small axis font sizes, particularly the bottom panels, resulting in a lack of clarity over the orientation and the scale of the plume. • Figure 10-36, pg. 788. Similar to the above comment, Figure axis labels are small and illegible. • Table 10.63, pg. 816. Within the 'Currently expected base case' for 'Power generation on the FPSO', the third sub-bullet point starts 'd water'. It

	Balushkin 1994 are in the wrong order because of a missing comma in the former.		
Xodus Group			
Xodus 1	Page 170: There is no evidence presented to demonstrate the selection or analysis process used to assert that fuel use will be minimised, other than reference to the use of electric drives (rather than mechanical turbine drives for pumps/compressors).	Navitas has committed to reducing and minimising its emissions. By way of example, in FEED for the FPSO Navitas has instructed the contractor to implement practical technologies to minimise emissions. Navitas shall continue to consider and implement reduction measures throughout execution and operations phases of the development and, as explained in the EIS, these shall be detailed in the EMMP and Navitas shall be accountable against this. It should be noted however, The Field Development Plan and EIS is based upon using an existing FPSO and there is a balance between the potential benefit of reusing existing equipment and replacing with new equipment within the constraints of the existing facility.	N/A
Xodus 2	Pages 170/171: There is significant difference in terms of potential efficiency gains by employing a CCGT, in the region of 15 to 20% and we would expect to be considered in an analysis of the energy efficiency of the system.	Refer to Xodus 1 above	N/A
Xodus 3	Page 171: VSDs (usually employed as Variable Frequency Drives) offer a huge potential to reduce energy usage and associated emissions. It is a well-established, widely adopted, and proven technology. Fixed speed motors cannot be considered ALARP, unless offset by careful sizing and sparing strategy that would make the additional capital excessive.	Refer to Xodus 1 above	N/A

Reference	Request for information	Navitas response	Addressed
Xodus 4	Page 171: Power factor correction is reducing reactive power, through addition of capacitors or other measures, to reduce overall power consumption required for the same useful output. This is a well proven technology, widely used in onshore and industrial applications, but not traditionally employed in offshore oil and gas developments.	Refer to Xodus 1 above	N/A
Xodus 5	Page 171: It is apparent by inspection that through the application of readily available technology and carefully matching the electrical demand to the power plant output then a significant reduction in fuel use related emissions can be achieved over that currently proposed. For example, if sufficient design changes were implemented to reduce the apparent load to allow operation on one gas turbine at maximum efficiency, fuel gas savings of nearly 50% would be possible, over those values currently stated	During the FEED phase the Electrical Load List will be further refined to minimise power demand. Motor starting cases and options (including the potential selective use of VFD's, soft starters, low in-rush motors, Voith couplings, etc.) will be reviewed with the goal to minimise fired power generation units online within the practical constraints of a redeployed FPSO.	N/A
Xodus 6	Page 169: Proposed use of gas fired steam boiler for heating injection water and maintaining available auxiliary steam boilers are a concern. This heating duty could potentially be met with heat supplied from the WHRU. Our experience of new build FPSO design provides a comparative example with heating of oil and produced water (to 90°C *vs.* the stated 70°C for the Navitas FPSO), and all marine system heating being served with heating medium carrying waste heat and heat integration. Heat integration does not appear to have been considered. Technical justification should be provided to show why an additional steam boiler is required and that the duty cannot be met with waste or integrated heat.	Refer to Xodus 1 above Additionally, it should be noted that a further optimisation of the Pre-FEED design has been completed since the submittal of the EIS and the additional steam boilers have been removed from the design and the existing Auxiliary Boiler will be converted to fuel gas service from liquid fuel. Please note that WHRUs do exist on the current Gas Turbine Power Generation Units and it is not practical to retrofit on the redeployed FPSO.	N/A
Xodus 7	Page 169: The requirement to have auxiliary boilers (and to run them for 1 day per month) should also be reviewed. With adequate design, a high availability should be able to be achieved for the WHRU and heating medium system (the WHRU is simply a mechanical linkage attached to a louver in the exhaust stack, with very little to go wrong).	Please see response to Xodus 6.	N/A

Reference	Request for information	Navitas response	Addressed
Xodus 8	Page 154: There is no immediately apparent technical reason why any continuous flaring would be required to commission and start up the gas compression system. Small, transient amounts will be flared if the system is shutdown and restarted multiple times as would be required during commissioning, however each start/shutdown cycle would be, indicatively, in the region of a few tonnes of gas. Our recommendation would be that concurrent flaring to allow oil production is unacceptable and technically unnecessary. The plant start up should prioritise production of the highest GOR well possible to provide hydrocarbon gas for starting the gas plant, prior to commencing oil train start-up, or detailed technical justification provided as to why this is not possible.	The FDP and EIS plan to execute a start-up with minimal flaring of Associated Gas, we have provided for the normal sequence of an oil production facility. Normal practice is to start Utilities, then introduce production fluids through the separation system, establishing steady state flow. During this temporary short term period, Associated Gas is flared, until the Gas System can be put online. The EIS has made an allowance for flaring during these commissioning activities however Navitas will work to minimise these periods during design and operations phases.	N/A
Xodus 9	Page 177: Section 5.8.4.3 Gas Management System, states: “Where possible, any gas not required for fuel or lift gas will be reinjected into the GI well.” “Where possible” is very non-committal language for a crucial part of operating philosophy, with respect to minimising emissions. Flaring of produced gas with a no export route constitutes routine flaring and would be at odds with World Bank Zero Flaring initiative.	To clarify, there is no plan for routine flaring, this is clear in our FDP. Any excess gas not being used for lift gas or used for fuel gas will be re-injected and flare reduced to minimum safe flare.	N/A
Xodus 10	Page 182: Section 5.8.5.4 Produced water process describes the use of a degasser and potentially gas floatation unit. Both of these will have a low-pressure hydrocarbon vent stream – it should be confirmed that this stream is recovered to the flare and/or VRU.	We can confirm the use of Hydrocyclones and a Compact Gas Floatation Unit (CGFU) for Produced Water processing. It is confirmed that vapours from the low pressure CGFU will be captured *via* the VRU.	N/A
Xodus 11	Page 801: By inspection the rated power for some of the process pumps appear very low considering the proposed design rates, notably the “Degassed Water Pumps” – at 72 kW.	Produced water processing rates for the Sea Lion FPSO align with the current design rate of the analogous FPSO for the purposes of the EIA, and as such the rated power is deemed adequate.	N/A
Xodus 12	Page 795: Given the links between the Falklands and the UK, the NSTD and OGA Plan for emissions reduction guidance should be referenced and the applicability discussed.	The EIS complies with FIG regulation, and the NSTD / OGA policy guidance referred to has not been adopted by the Falkland Islands.	N/A

Reference	Request for information	Navitas response	Addressed
Xodus 13	Page 799: Review and document selection of main power generation technology, considering as a minimum CCGT; other hybrid and or renewable generation (e.g., wind) may also be considered to supplement gas power generation.	Please refer to Xodus 1.	N/A
Xodus 14	Page 815: A holistic and integrated review of power generation usage profiles, taking into account the above possibilities to ensure that fuel use and related emissions are minimised. Ensure all power users are accounted for and dynamic loads (power *vs.* throughput curves) used for main items of equipment, e.g., compressors and water injection pumps.	Please refer to Xodus 5	N/A
Xodus 15	Page 820: Recalculate and provide justification for FPSO power generation fuel use. The fuels gas use values appear to be arbitrary, with the incorrect assumption that power use declines with oil production and no calculation or justification provided. The fuel use should be linked to the fluid processing rates, equipment capacities and include consideration of generator efficiency curves.	Power use will reduce over time for the FPSO. As Oil production decreases so does Associated (Produced Gas), requiring less compression power as Re-injection Gas rates will decrease. Water heating requirements will reduce over time and the injection power requirements will remain at approximately the same level until Total Produced Liquids rates fall below the nameplate capacity of the facility and, therefore, voidage replacement requirements decrease.	N/A
Xodus 16	Pages 34, 130, 168, 177, 591, 603, 797, 1269: Provide clear commitment to, and design basis for, gas reinjection: i) there is an apparent discrepancy with produced gas rates and ability to re-inject this gas should be clarified	There is no discrepancy between Produced Gas Rates and Re-injection in Phase 1. Sufficient Gas Compression capacity exists to re-inject all Associated Gas. Gas Lift rates will vary within the Gas Compression design limits to ensure Gas Injection is maintained.	N/A
Xodus 17	Emissions spread-sheet: ii) assumed availability of gas re-injection is 98.4% (shutdown for 6/365 days per year) - this should be backed up by calculation to show that this high availability is achievable based on equipment selection, sparing and maintenance plans, e.g., through RAM,	RAM studies will be completed during FEED to validate the assumed availability. If the reliability is lower, production will be temporarily curtailed	N/A

Reference	Request for information	Navitas response	Addressed
	and reference to OREDA (Offshore Reliability Database) values, or similar, and matched to predicted production profiles, referencing P10/50/90 cases as applicable.	thereby not negatively impacting emissions. Furthermore, see response to Xodus 19	
Xodus 18	Page 827: Provide clear design basis for vapour and flare gas recovery, considering stripping gas rates, reasonable valve leakage rates and purges. It should document operability, maintainability and resultant availability of the lowpressure flare and vapour recovery systems, backed up through calculation, e.g., through RAM modelling, and reference to OREDA (Offshore Reliability Database) values, or similar, and matched to predicted production profiles, referencing P10/50/90 cases as applicable. The terminology "VRP" or "VRU" is often used to describe a type of scrubbing system that removes volatile organic components (VOCs) or nonmethane NM-VOCs. This system recovers some of the heavier components from the vent stream, while the residual methane is vented. Best practice would be to integrate the VRP with the FGR and recover the HC gas back to the process.	HP Flare will have no continuous feeds to the flare system. HP system purge will be Nitrogen. LP Flare will have several continuous feeds to the flare system including Cargo Tank fuel gas blanketing, LP system fuel gas purge, various low pressure feeds from Process Systems (e.g., Produced Water CPFU, Oil Treater Overheads, etc) – as the LP Flare system will be a closed system, all will be captured *via* the VRU.	N/A
Xodus 19	Page 820 & Emissions spread-sheet: The production uptime is assumed to be 100% for the calculations, however there are conflicting statements within the EIS. In Table 10.63 it is stated that "Fuel gas is expected to be available for 93 - 95% of the time. Downtime of the fuel gas relates to times of no production due to planned or emergency shutdowns", however in Section 5.8.3.2 "it is expected that fuel gas will be available for 100% of the time once the system is fully commissioned." We would expect uptime to be between 85 – 95% of the time, and the emissions calculations adjusted to reflect this.	In presenting emission values based on 100% uptime Navitas has presented the conservative values which provides an over estimate of emissions to cover all scenarios, essentially bounding the upper limit which is in accordance with the agreed EIS philosophy. This scenario assumes 100% uptime of gas whereas the downtime is factored in for diesel use i.e., fuel gas and diesel both in use when fuel gas is down.	Section 10.9 Table 10.69
Xodus 20	Emissions spread-sheet: It is recommended to align the production uptime with that used in the economic and reservoir/production modelling.	Please refer to Xodus 19.	N/A
Xodus 21	Page 816: The production profile, Figure 5-8, shows gas, total fluids and water injection rates all increase until year 15. The oil rate reduces but this	Power requirements will reduce over the life of the field. After Year one, heating of the Injection Water	N/A

Reference	Request for information	Navitas response	Addressed
	could only account for a small portion of the reduction perhaps a 100 kW, and likely and oil transfer pumps would simply be in recycle. Further the water handling rate increases offsetting any reduction. The statement: The need for power over the life of field decreases as production volumes decline appears to be fundamentally incorrect. The entire premise of fuel gas use calculation appears questionable. This is of major concern as these emissions make up approx. 80% of the total life time emissions.	will no longer be required. Oil heating requirements will reduce with lower oil production rates. Injection Water/Produced Water pump power demands will remain approximately equal until Total Produced Fluids drop below nameplate (once Oil rates cannot make up the difference between the capped Produced Water Treatment capacity and the Total Fluids processing capacity) and the voidage replacement requirement starts to decrease.	
Xodus 22	Page 169: In our experience, the peak efficiency of a Solar Mars on fuel gas is around 35%. We did an approximate calculation for the fuel gas rate to the turbines in years 1 and 2, assuming a 50/50 split of fuel gas turbines, on full load and a fuel gas composition of approximately 75% CH4, and the resultant efficiency was around 20%. This suggests that the turbines are operating inefficiently for the majority of the asset life and possibly indicates an overestimation of fuel gas requirements	The Sea Lion EIS has utilised conservative efficiencies which provides an over estimate of emissions to ensure we capture all potential scenarios. The Aoka Mizu was used as an analogous vessel for the purposes of the EIS.	N/A
Xodus 23	Page 800: The key consumers of electricity (Table 10.55) have single assigned values for power demand. This is incorrect, especially for intermittent sources such as offloading and propulsion. In addition, the sources do not include any associated equipment for FGR or the VRP. We would typically expect an increased power consumption resulting from the inclusion of additional equipment such as a compressor. If this is incorporated into Table 10.55 it should be clearly labelled as such. However, given the statements above, the power use profile appears not to have been used in estimating the fuel gas consumption	Navitas did not use the power use profile. A flat fuel consumption profile was assumed that will be conservative in the related emissions estimates. The post-consultation EIS will be reviewed to ensure that this is clear.	Table 10.59
Xodus 24	Page 828: There is misalignment in the approach to inclusion of indirect GHGs, as the language in Section 10.9.4.5.1 suggests omission of these would be an underestimate of emissions. However, IPCC reporting does not include indirect gases, and therefore any reference to these being an underestimate should be treated with caution.	Navitas will delete the sentence: “Further, they do not include the indirect gases.”	Section 10.9.4.5.1

Reference	Request for information	Navitas response	Addressed
Xodus 25	Page 819: The required [HP purge and pilot] rate [is] affected by flare tip and seal design, and should be carefully considered, with a view to minimising. Robust means to measure and control the purge rate are also essential. We would also suggest investigating the option of an inert gas purge (e.g., nitrogen) to reduce continuous emissions and maintain the integrity of the flare.	The purge rates for the Aoka Mizu have been confirmed to be significantly lower than originally informed in the EIS – additionally, refer to the clarifications provided to the comment on Page 827 above (Comment #18). Navitas shall update the Post-consultation EIS accordingly to this effect.	Section 10.9.4.4.5
Xodus 26	Page 177: We would typically expect consideration of a ballistic ignition system for FGR, allowing the pilot to be removed while providing a reliable spark. This does, however, require a robust flare monitoring system. Several sections of the EIS refer to the removal of a pilot as "not currently sufficiently proven", however this has been routine in Norway for a number of years. Although not suitable for every installation, it is something we would expect to be assessed for the development.	Navitas will review and monitor the technology and consider implementation when appropriate. Navitas will review the post-consultation EIS to ensure that this commitment is clear and consistent throughout.	Section 10.1 Section 15.7.1
Xodus 27	Page 826: The inventory blowdown calculation (Section 10.9.4.4.5.1) is based on a specified time and gas rate, based on the 15 min API requirements. However, depressurisation will continue beyond this 15 min period in reality. A simple and more accurate approach is to consider the change in mass of gas using the actual pipe/vessel volume and the start and end pressures. This would provide a more realistic and accurate representation of the inventory release. It is also noted there is an error in the total calculated CO_2e emissions in Table 10.69 (missing decimal point).	The missing decimal point will be corrected in the post-consultation EIS. Due to the typical pressure decay curve associated with a blowdown the mass inventory remaining after 15 minutes would be relatively insignificant in comparison. Please note that the inventory blowdown calculation will be refined during FEED.	Table 10.75
Xodus 28	Page 827: Inert gas changeover: Section 10.9.4.4.5.2 Venting emissions offshore states a value for the HC gas emitted during the changeover, which is reasonable, but this value is not included in the calculations, on the basis the availability of the VRP cannot be estimated, yet the this is comparable to the number of ESDs	The cargo blanket gas has been updated to Fuel Gas from Inert Gas so this comment should be satisfied. The Fuel Gas blanketing the Cargo Tanks will be recovered *via* the VRU.	N/A

Reference	Request for information	Navitas response	Addressed
	assumed, or the assumed number of days per month that gas injection is not available. The residual methane and VOCs evolved from the stabilised crude when blanketed within inert gas are also not included.		
Xodus 29	Page 827: Section 10.9.4.4.5.2 states "venting estimates are not included in the overall estimates of the development emissions, or annual average, as it is not possible to credibly estimate how often this may be required". However, the emissions are then estimated as 78 tonnes.	The RAM study to be conducted during FEED will help inform the anticipated number of venting events. Operational data will be used from First-Oil to inform the Sea Lion Emissions model. During the commencement of Production and over the first year of production, it is reasonable to assume spurious trips will be more frequent then decrease as the Operations team becomes more experienced in the operation of the FPSO and any residual Commissioning issues are addressed. Navitas will review the statements on venting in the post-consultation EIS, and will include an estimate for fugitive emissions.	Section 10.9 Table 10.69
Xodus 30	Page 130: "This associated gas will be used for fuel on the installation, for 'gas blankets' in cargo / slops tanks and for 'gas lift' to improve the oil recovery. Any surplus gas will be re-injected into the GI well." It is noted that there is "dehydration" gas process which typically uses fuel gas as stripping gas. There is no mention of this fuel gas user. Query if this is the case, and if so, should be captured in emissions etc. or discussed as a user that is recovered in the closed flare or VRU	Stripping Gas from the Gas Dehydration Unit will be recovered *via* the LP Flare system to the VRU.	N/A
Xodus 31	Page 168: Table 5.14. Is gas handling capacity going to be upgraded prior to Phase 2? There is no mention of this. Important as gas production would exceed Phase 1 design rate and will result in large amounts of flaring.	Emission calculations are consistent with our plan to deliver Phase 1 & 2 production. Navitas will update	Section 5.8.2.2 Table 5.14

Reference	Request for information	Navitas response	Addressed
		Table 5.14 in the post-consultation EIS, and ensure that the information presented is consistent in the FDP. Section 5.8.2.2 will be edited to read; 'The FPSO will be designed to deliver the FDP production profile for both Phase 1 and 2. Minor upgrades to topsides equipment or updated operating procedures may be implemented to achieve target rates.'	
Xodus 32	Page 176: "Flare purge and pilot" It is noted that there is no inclusion of Flare Purge rates within Chapter 10.9, and therefore no emissions associated. Specifically, important for purge rates on HP flare as current design states that this flare is not closed.	Please refer to the comments made to Xodus 18.	N/A
Xodus 33	Page 177: "The FPSO has a gas handling / compression capacity of 50 mmscfd." Table 5.14 states that gas handling for Phase 2 will be 130 MMSCFD. 50 MMSCFD may not cover anticipated production profile, or gas lift requirements. This may result in additional flaring and increased emissions.	Emission calculations are consistent with our plan to deliver Phase 1 & 2 production. Navitas will update Table 5.14 in the post-consultation EIS, and ensure that the information presented is consistent in the FDP. Section 5.8.2.2 will be edited to read: 'The FPSO will be designed to deliver the FDP production profile for both Phase 1 and 2. Minor upgrades to topsides equipment or updated operating procedures may be implemented to achieve target rates.'	Section 5.8.2.2 Table 5.14
Xodus 34	Page 169: It is unclear if the production P50 profiles, e.g., in Figure 5-8 is the associated gas rate, or the total gas rate, including gas lift (which is essentially circulated). It would be good to see a clear balance of associated produced gas profile, or maximum rates compared with the gas injection capacity, and the total gas plant rate matching with compression train capacity	The simulated production profile displays produced gas, which does not include gas lift. Navitas can deliver the profile within the stated facility constraints.	Figure 5-8

Reference	Request for information	Navitas response	Addressed
		Navitas shall update the Post-consultation EIS to this effect.	
Xodus 35	Page 177: "On the High Pressure (HP) flare system there are no continuous sources such that no recovery system is required" It is best practice to close the HP flare by design. It is anticipated that the HP flare system would have purge gas, typically fuel gas, which would be considered a continuous source to flare. Additionally, closed flare system would allow for the capture of any other intermittent sources, or for example passing valves.	Please refer to Xodus 18. It is common practice in recent developments to apply a Closed Flare design to the LP Flare system (as is being done here). Applying a Closed Flare design concept to the HP Flare (in addition to the elimination of any continuous flare sources, including purge gas, as noted above) is much less common, due to the inherent increased consequence of a failure in the fast-acting valve system and additional safeguards.	N/A
Xodus 36	Page 177: "The pilot flames are expected to burn approximately 0.5 - 1 mmscfd." Flare pilot rate is stated to be very high (based upon EIS 0.5 MMSCFD = approx. 14 tonnes per day). It is generally anticipated that flare pilot typically be an order of magnitude lower.	The statement, as written, is overly conservative these values include continuous flare sources, including fuel gas purges (which, as noted above, have either been eliminated *via* Nitrogen purge for the HP Flare, or captured back to the VRU for the LP Flare). Navitas shall update the Post-consultation EIS accordingly to this effect.	Section 5.8.4.4 Section 10.9 Table 10.69
Xodus 37	Page 193: "use of fuel for the back-up generator would be offset against the reduced fuel use at the power station such that no additional emissions would result." No calculation to back this up.	The comment assumes that power generation efficiency is equivalent. Navitas shall update the Post-consultation EIS accordingly to this effect.	Section 5.11.1.2.1
Xodus 38	Page 211: "No routine flaring during normal production (notwithstanding the flare pilot light), "Use of a Flare Recovery Package during normal operations," Continuous flare source would also include flare purge (assuming that this is	Please refer to the comments made to Xodus 18.	N/A

Reference	Request for information	Navitas response	Addressed
	fuel gas purge). This would be recovered in LP flare, however as HP Flare is not closed this would be continuous emissions to atmosphere.		
Xodus 39	Page 797: Global Methane Pledge - OGMP 2.0 Framework should be referenced as best practice.	The UK has signed up to the Oil and Gas Methane Partnership (OGMP) 2.0 in 2022, but Navitas' understanding is that this does not include the Falkland Islands. EIS Section 10.9.1.1.2 currently includes the statement that 'Navitas strive to comply with the principles of the Methane Pledge with the target of zero cold venting as part of the Phase 1 & 2 Development basis of design, and similarly with the ZRF initiative to achieve zero routine flaring. ' Navitas are aware of the updated GMP 2.0 Framework and that the UK has signed up to this. Once UK legislation has been amended to enact the requirements of the GMP 2.0, Navitas will review the requirements, and its commitments, in discussion with FIG. This will be added to the post-consultation EIS for clarity.	Section 10.9.1.1.2
Xodus 40	Page 800: Table 10.55 Power demand rates should consider transient operations, particularly propulsion and offloading.	The Load Study will be revised during FEED. Propulsion power requirements are expected to be very low, which will be reflected in the Demand Factor of the Load Study and is not expected to impact overall Power Requirements. Offloading cases will be defined specifically in the Load Study – Load Shedding may be implemented.	N/A

Reference	Request for information	Navitas response	Addressed
Xodus 41	Page 804: To mitigate any uncertainty, only AR5 without climate feedback should be presented in the main body of the report and used for the subsequent calculations	All calculations have been carried out using the AR5 W/O feedback. Different GWP values are only used to enable like-for-like comparisons where the dataset being compared to used GWP's other than AR5 w/o carbon feedback. Where this is necessary, this is indicated within the relevant EIS section.	N/A
Xodus 42	Page 808: Ocean acidification - unclear why this is included but not any other element of the physical environment.	Ocean acidification is itemised as this is a separate impact resulting from CO_2 emissions and does not fall under the umbrella of impacts associated with climate change. The known impacts of emissions are described in Section 10.9.4.2 on the 'Nature of the Impact' which itemises the broad physical impacts associated with climate change, ocean acidification and acid deposition. The climate change impact assessment does not itemise each physical impact e.g., sea level rise, changing climate zones etc. as it is not possible to meaningfully assess the severity of effect that may result from Navitas' emissions alone. Of note, The DMR EIA guidance requires the EIS to look specifically at the impact of emissions on water quality (4c of Schedule 4), see Appendix 2 of the EIS.	N/A
Xodus 43	Page 817: Table 10.63 – "Production levels at the P50 case" Inclusion of associated produced gas for context of fuel gas usage would be beneficial.	This is shown in the 2C production profile (Figure 5-8).	Table 10.69
Xodus 44	Page 812: Figure 10-37 Figure is outdated, and more relevant information is available from NSTA for current operations. No indication of boundaries of this figure (e.g., scope of emissions).	Navitas shall update the Post-consultation EIS with a graph detailing the actual numbers.	Table 10.65 (replacing the figure)

Reference	Request for information	Navitas response	Addressed
Xodus 45	Page 816: "the average fuel gas consumed will be *c.* 5.5 mmscfd." The approach of averaging the fuel gas consumption does not account for the gas turbine efficiency or adequate capacity for different operating modes. This could result in the equipment being undersized for the required capacity.	The Fuel Gas System will be designed to accommodate peak Fuel Gas Rates as dictated by the Power Generation System.	N/A
Xodus 46	Page 817: "POEPL assumed a conversion rate of 1 mmscf gas = 27.8 t, which, based on the samples, Navitas consider to be highly conservative" One gas composition (and therefore conversion rate) should be used for both cases. As the gas composition is available, we would expect asset specific emissions factors for flaring and venting estimates, as this would provide more accurate figures. The gas composition is changed between base and worst-cases, which is the source of about ~60% of the difference in FPSO related emissions (gas conversion rates given in Table 10.63). Typically, we would expect this to remain constant for a fair comparison, with a sensitivity for both cases if the composition is unknown.	Updated conversion factors and emissions factors will be considered by Navitas in the future update of the EIS and/or when reporting annual emissions. Navitas used a conservative conversion rate for the worst-case but will use the Navitas calculated conversion rate for both cases in the post-consultation EIS following consultation with FIG. The post-consultation EIS will be checked to ensure that the quoted gas composition is consistent throughout.	Table 10.69 Table 10.72 Table 10.73 Table 10.74 and all references to numbers in the text throughout
Xodus 47	Page 819: Table 10.63 implies that combustion of the sold product emissions is considered for the worst-case only. The boundary of the assessment should be clearly defined and consistent for both cases.	Table 10.63 will be clarified in the future EIS update to reflect that Combustion of sold product would be the same for both worst-case and current expected scenarios. At this stage the final use of sold product is not known, so Navitas has assumed a worst-case that all is combusted. Navitas will update the post-consultation EIS and merge cell across both columns of table 10.63 to reflect this.	Table 10.69
Xodus 48	Page 820 Emissions spread-sheet: Vessel fuel consumption The fuel consumption is calculated as an average of different activities.	The daily vessel consumption is based on an averaged consumption rate. This provides the clearest, fairest and most logical approach to establishing the long-	N/A

Reference	Request for information	Navitas response	Addressed
	For clarity each activity fuel consumption and expected days should be outlined.	term vessel usage and emissions. Taking the example of a PSV (Pacific Leader): - 7.5mt per 24 hours in transit at economical speed (11 kts) - 14mt per 24 hours in transit in heavy weather at 14 kts - 5.55mt per 24 hours station keeping on DP alongside the MODU or FPSO - 3mt per 24 hours when “drifting” on a single engine outside the 500m zone of the MODU / FPSO awaiting loading / discharge operations - 2mt per 24 hours when alongside a harbour (such as the TDF) Splitting the vessel usage timings across a 30-year schedule on this basis would be unrealistic. Again, looking at the PSV usage by way of example, a 48-hour period could consist of the following activities: - 12 hours transit at 11 kts from TDF to FPSO - 2 hours waiting on the FPSO to be ready (drifting on a single engine) - 3 hours on DP offloading cargo - 2 hours drifting - 3 hours on DP backloading cargo - 14 hours transit at 11kts from FPSO to TDF through heavy weather - 9 hours go to anchor awaiting a berth at the TDF - 3 hours alongside the TDF The averaged consumption rate for all example vessels has therefore been based upon:	

Reference	Request for information	Navitas response	Addressed
		1. Expected usage patterns 2. Previous analogous experience and 3. Case studies using typical vessel types Navitas believe that this provides a conservative, true and fair usage / emissions benchmark across the lifetime of the emissions model and will work to optimise and reduce this during the field life.	
Xodus 49	Page 821: Table 10.64 – "Unplanned Events" Does this capture flaring on start-up following the shutdown, as well as the emissions associated with the shutdown event itself?	Navitas can confirm that the table includes flaring during startup post an unplanned shutdown.	N/A
Xodus 50	Page 822: Table 10.65 Emissions factors use multiple sources. Suggest for each activity a single source is used. For consistency this should be one data source. Where gas composition is available, asset specific factors should be used for flaring and venting.	EEMS was not used because there are more recent EFs available from reputable sources for calculation of direct GHGs. Calculation of the annual GHG Inventory must be carried out by Navitas during operations according to the GHG Protocol and ISO14064 standards which requires the most recent emissions factors available – EEMS is outdated for direct GHGs, but UK government factors do not include indirect EFs. Indirect GHGs are not included in the total CO_2e calculation, therefore use of multiple sources is not impacting CO_2e calculations. Once operations commence, this will be considered for annual recording & reporting going forward.	N/A

Reference	Request for information	Navitas response	Addressed
		Project Specific Emission Factors will be prepared once validated process data becomes available.	
Xodus 51	Page 826: Emergency blowdown calculation The volume of gas released should be calculated using pipe volume and pressures.	Please refer to response Xodus 27.	N/A
Xodus 52	Page 827: "Note that venting estimates are not included in the overall estimates of the Development emissions, or annual average, as it is not possible to credibly estimate how often this may be required." Recommended that assumptions are made for this and captured in worst-case project emissions forecast.	Please refer to response Xodus 29.	Table 10.69
Xodus 53	Page 827: In Table 10.69 there is a mix of significant figures and data errors.	This has already been identified by Navitas. Statements explaining the rounding will be added to the revised Emissions Chapter.	Section 10.9 Table 10.75
Xodus 54	Page 831: "These show that the average carbon intensity estimates per annum, based upon the worst-case assumptions itemised in Table 10.63 above, range from 25.8 – 35.2 $kgCO_2$/boe" Confirm how these carbon intensities have been calculated. From Figures 10-39 to 10-41 this seems low.	Total Worst-case life-of-field Emissions Intensity ($kgCO_2e$/boe) = (Total emissions over life of field in tonnes CO_2e x 1,000 to convert to kg) / (Total oil production in barrels for each production case). e.g., 'worst case' P50 average EI = (7,332,951 tCO2e * 1,000)/(310.5 MMbbl * 1,000,000) = 23.6 kgCO2e/boe . Navitas will add this as a footnote in EIS Section 10.9.4.5.4.	Section 10.9.4.5.4 **Note:** the estimates mentioned in the response column have subsequently reduced following changes to the gas conversion rate in response to Xodus 46
Xodus 55	Page 831: "Assuming the producing installation will be a 'lease and operate' FPSO, refitted between 11 - 25 years ago, the average P50 carbon intensity, and indeed all the carbon intensity estimates above, can be compared to the UK average carbon intensity of 39 $kgCO_2$/boe (Section 10.9.4.3.2.3) indicating that the Development is comparatively efficient."	At the time of publishing the EIS, the 2023 NSTA Emissions Monitoring Report was most recent which stated carbon intensity (i.e., CO2 only) for Floating Installation 11-25 years = 36 $kgCO_2e$/boe. NSTA Emissions Monitoring Report 2024:	Section 10.9.4.3.2.3 Section 10.9.4.5.4

Reference	Request for information	Navitas response	Addressed
	Not equivalent comparison. The development should be treated as a new FPSO.	Emissions intensity of Floating Installation 0-10 Years = 20 $kgCO_2e$/boe Emissions intensity of Floating Installation 11-25 Years = 36 $kgCO_2e$/boe Note – NSTA averages reflect actual reported operational emissions intensity (Scope 1), whereas EIS presents worst-case. Navitas shall update the post-consultation EIS with the 2024 NSTA report. EIS Section 10.9.4.4.4 notes that currently expected emissions from Sea Lion are 17.9 kgCO2e/boe. This section also notes that 'when the personnel transportation, drilling and vessel emissions are excluded to enable better like-for-like comparison with UKCS emissions reported to the NSTA, the carbon intensity is estimated to be 14.2 $kgCO_2e$/boe (section 10.9.4.5.4).' Consequently, Sea Lion current expected case carbon intensity benchmarks under the NSTA average for an FPSO of 0-10 years. This is without the additional emissions reductions measures that will be considered in FEED and the ERAP.	
Xodus 56	Page 829: Comparison with UKCS emissions Assumptions are not consistent with those from UKCS (e.g., EEMS is standard in UKCS for unknown emissions factors) and the scope of assessment is different. It is not correct to compare the averaged annual	UKCS numbers used for the comparison represent an average of all fields which include production from fields at all phases of field life, so comparing to the Sea Lion total average number is not unreasonable	N/A

Reference	Request for information	Navitas response	Addressed
	emissions for the development, it should be compared on an annual basis. We would expect EEMS to be used as standard if asset specific emissions factors are not available.	and more representative than using just a single arbitrary year from Sea Lion. Reported UKCS emissions are actual operational emissions (Scope 1 only).	
Xodus 57	Emissions spread-sheet: Cold venting uses the OGP emissions factors, with a value of 7 for methane given in Table 10.65. We suspect this is a typo and should be 0.7. However, we would be expecting EEMS to be used to be consistent with other emissions factors. We suspect methane has been overestimated in the current calculations by use of 7 tCH4 / t pollutant as the emissions factor, given in Table 10.65.	Navitas will work with FIG to determine the required methodology that will be adopted for emissions reporting. This will not be to OPRED *via* EEMS but Navitas consider it is likely to be aligned with GHG protocol/ISO 14064 standards.	N/A
Xodus 58	Page 833: Comparison with UK carbon budget This comparison is incorrect. We would recommend estimating emissions from the development for each relevant 5-year budget period and presenting as a percentage of the 5-year budget	Navitas note this comment and the post-consultation EIS will be updated to reflect this.	Table 10.79
Xodus 59	Page 837: Cumulative impact (Section 10.9.9) seems to solely consider other oil and gas activity. It is unclear why this is the case, as we would expect GHG emissions from all activities to contribute to cumulative impacts, making the assessment challenging. Setting this in the context of carbon budgets or net zero targets (for example) enables some consideration to be achieved but this comparison shouldn't be limited to oil and gas. We also noted that the source of NEFL and POEPL emissions numbers in Table 10.72 should be referenced	As described in 10.9.4.3.1, historical GHG emissions from other sectors e.g., fishing, O&G, shipping, aviation and other industries in the region are not available within the Falkland Islands data set, and nor are projections available. The predicted O&G emissions data provided in Table 10.81 (previously Table 10.72) were taken from the previous EIS's submitted and these were used and itemised as the only data available. While Table 10.62 (previously Table 10.58) does provide a breakdown of historic Falkland Island emissions by sector (albeit without data from the above activities), these are of little value when considering the future project emissions. Data from Table 10.62 could be extrapolated but this is considered to add little value and while the	Sections 10.9.4.5.1 & 10.9.9 Table 10.81

Reference	Request for information	Navitas response	Addressed
		reported Falkland Islands emissions should go down as efficiencies improve, in reality they will go up when aviation, shipping etc. are included. The data in Table 10.81 will be referenced in the updated EIS. Section 10.9.4.5.1 has been updated with a footnote. **Note:** comparisons with LULUCF and waste were not included as these are not 'sectors'. We have received 2023 data from the FIG Environment Dept, we did not feel it appropriate to include this data as this would be deviating from data that was provided in the ES during public consultation. As data matures, Navitas will monitor the opportunity to undertake more robust sectoral comparisons.	
Xodus 60	Page 838: "compare 'like-for-like' emissions data" A like-for-like comparison has not been carried out. The calculated emissions from the development should be presented in such a way that a direct comparison can be taken, such as defining scope 1, 2 and 3 emissions, instead of stating that they "may be over-represented". We would suggest a table outlining the scope 1, 2 and 3 emissions with inclusions and (where applicable) exclusions with justification.	Navitas is not clear on the comment as the only reference to 'like-for-like' on page 838 is in Section 10.9.10 which is the confidence assessment. This reference to 'like-for-like' is simply making the point that, where possible, comparisons were made using comparable GWPs etc. However, it is recognised that true like-for-like comparison is not possible as North Sea operators all use different boundaries, emissions factors and GWPs etc. What is presented is based on the best information available to provide the reader with a like-for-like comparison. Nonetheless, the reference will be removed to avoid confusion. Navitas has provided an estimate of all direct and indirect operational emissions across the full life of	Section 10.9.10

		the project. This will include Scope 1, 2 and 3 emissions. However, it is premature to assign the estimated emissions to particular Scopes at this stage of the project. According to the GHG Protocol, assignment of Scope 1, 2 and 3 relies on specific criteria around operational and financial control. Since no contracts are yet in place for this project, it is not clear which categories some sources would be assigned to, risking presenting a misleading view of emissions by scope at this point in the project. Annual reporting of actual GHG emissions will be done according to the GHG Protocol, an internationally recognised standard for emissions accounting, and will include classification of emissions by scope as part of that reporting. While the EIA Guidance suggests that FIG needs to know how the industry will increase emissions in comparison to other local sectors, and that FIG can provide data (FIG EIA Guidance 3.15), FIG Environment was not able to provide sufficiently detailed data to enable any meaningful sectoral comparisons to be made. 10.9.4.3.1 notes that the Falkland Islands emissions do not include emissions from international aviation and shipping and that these and other omissions must be taken into account when making direct comparisons. It states further that all comparisons between the Phase 1 & 2 emissions and Falkland Islands emissions must be caveated. Noting these caveats, in 10.9.4.5.1, Navitas has provided an assessment of the Phase 1 & 2 development in comparison to Falkland Islands emissions using the data available.	

Reference	Request for information	Navitas response	Addressed
Xodus 61	General: We would encourage inclusion of embodied carbon for construction and drilling, providing a full picture of the development emissions. As scope 2 and 3 emissions are already incorporated, including the end use of the product, we feel like embodied carbon should also be considered	Embedded carbon emissions are not required under the FIG EIA guidance. Furthermore, OPRED and SAMS did not suggest this be considered in their compliance review. **Note:** Embedded carbon is a large, detailed piece of work and not commonly included in other UKCS emissions estimates for a development EIS. e.g., Rosebank EIS does not include embedded emissions. To Whom it May Concern

A response to 57-page Falklands Conservation submission to the Navitas Petroleum EIS.

We wish to comment on the widely circulated 57-page Falklands Conservation submission to the Navitas EIS.

Falklands Conservation states it works "*In partnership with government, industry and the global community…*" Accordingly, it should provide balanced environmental comments, positive and negative.

Falklands Conservation does not put its submission in the current Falklands environmental context: fishing, cruise, tourism and agricultural industries and civilian and military activities. The latter daily delivers the Falklands critical security. The main Falklands economic activities are significant, including:

- Cruise ships make approx. 200 calls to ports and islands in the Falklands. Each cruise ship spends days at sea to and from the Falklands. In addition, cruise passengers typically fly long haul to join the vessels that visit the Falklands.
- The fishing industry can have well over 100 hundred large fishing vessels operating in Falklands waters. Additionally, these vessels are supported by tankers, reefer vessels and a patrol ship.

The uncomfortable reality for us all, is that all human economic and most social activities produce emissions. While carrying out these activities, we seek to minimise the emissions. This includes the Falklands, where economic, social and governmental activities are necessary to sustain the Falklands and its Community. The Environmental Impact of the Sea Lion development needs to be considered in the context of current Falklands activities.

Registered No. 10417
Directors: S.P. Clifton, J.M. Morris, D.L. Clifton

The environmental impact of the Sea Lion development and operation will be a fraction of current Falkland Islands activities i.e. Sea Lion development will use state-of-the-art efficient vessels for:

A. Drilling & Installation. 18 months – 7 vessels. The Drilling Unit ('rig') will be supported by two Offshore Support Vessels (OSV) and an Emergency Response and Rescue Vessel (ERRV). These three support vessels will also support the field's construction and installation, including the Floating Production Storage & Offloading (FPSO). In addition, four Large Transport Vessels (LTVs) will be used to support the construction and installation operations, with a maximum of two vessels anchored in Berkeley Sound at any one time, for a combined total period of c. 13 months.
B. Production - c. up to 25 years – 3 vessels. The FPSO will be supported by an OSV and an ERRV.

This relatively low impact, in comparison to its size, is because most of the Sea Lion activity is contained, under the sea bed.

In their submission, Falklands Conservation highlight multiple issues. There is no environmental impact comparison with the current Falklands activities:

- CO^2 emissions. There is not a single reference to the emissions from current activities, which will be far greater than Sea Lion emissions. Current activities are not required to offset their emissions. The Sea Lion development plans to offset its emissions from drilling through production.

  The emissions from the final user using the oil produced by Sea Lion will be significant. However, it should be for the user of the oil to decide whether to offset these or not. No country, including the UK, USA, Norway, etc., makes a producer do this. It is up to the user to decide firstly what energy source to use, and then if they wish to offset any GHG produced. This seems fair and in line with 'User Pay' principles.

- bird strikes (including the incidental bycatch of sea birds)
- bird landings on vessels
- mammal entanglement or collisions - fishing by its nature requires extensive nets and lines
- underwater noise
- Berkeley Sound & Kidney Island. There is no comment at all about existing activities. A causal reader of the Falkland Conservation submission would think there are no commercial activities in Berkeley Sound or Port William! There is no recognition of fish transhipping and tanker bunkering activities. There is no comparison of the number of existing vessel movements, emissions and risks. In contrast, Sea Lion development will have a maximum of two vessels anchored in Berkeley Sound at any one time, for a combined total period of c. 13 months.

  The Falklands Conservation submission comments extensively about whales in Berkeley Sound. There is:
  - A much bigger risk of collisions with the Sei whales from fish transhipping and tankers bunkering fishing vessels operations and entering/departing
  - Sea bird colonies

Registered No. 10417
Directors: S.P. Clifton, J.M. Morris, D.L. Clifton

- Artificial Light – these are 24-hour operations and transhipping and bunkering require a significant amount of light to safely conduct

- Port facilities – Falklands Conservation raise TDF pile driving and dolphin sensitivity! The TDF causeway does NOT require piles! Falklands Conservation make no comments about the FIPASS port replacement with a much bigger causeway and quayside, which will require pile driving! This is an example of how biased their submission is.
- Sensitivity to oil spills - it would be helpful to compare the risks given the bunkering operations carried out by the usual two tankers, which carry out a lot of vessel bunkering in Berkeley Sound and offshore—all with NO tug assistance. In contrast, specialist OSVs will support the Sea Lion development movements.
- Artificial light inshore - the light pollution from Berkeley Sound and Port William transhipping operations radiates into Stanley. The number of vessels using FIPASS is many times the number of vessels scheduled to use the TDF, which is at greater distance from the Stanley residential area.
- Artificial light offshore— over a hundred jiggers can be operating at any one time. Cruise ship days throughout the Falklands inshore and offshore waters are significant. In contrast, the number of Sea Lion vessels and their light emissions will be proportionately much less.

It appears that current economic and social activities are acceptable to Falklands Conservation, as it is not agitating for these activities to have Environmental Impact Assessments or reduce their scale. Sea Lion development environmental impacts will be significantly smaller than existing Falkland Islands activities.

Falklands Conservation's 57-page submission does not include a single constructive comment. From their submission, Falklands Conservation are just anti-Sea Lion development. This is despite recognising that Oil and Gas will be part of the energy transition for the coming decades. Their submission is selective and one-sided and does not represent a balanced, fair submission.

Sea Lion development will likely have less impact on the points that Falklands Conservation has raised compared with the existing fishing and cruise industries. The fishing industry (catch and operations) has a bigger impact on sea birds and marine mammals than Sea Lion development will have.

Sincerely

D L Clifton

Director

19 GLOSSARY

Acronym / Term	Definition
Anthropogenic	Relating to human activities, or man-made
As Low As Reasonably Practicable (ALARP)	Often used in reference to mitigation measures where the benefit of the mitigation is weighed up against the relative cost and effort required to achieve that benefit.
At-shore	The shoreline and edge of the water.
Base-case	The design of the field before any project-specific mitigations are added to avoid, limit or ameliorate environmental impacts and risks.
Barrel	One barrel, equivalent to 159 litres (0.159 m^3) or approximately 35 imperial gallons
Bathymetry	The measurement of water depth in oceans, seas and lakes
Benthic fauna	Organisms that live on, associated with or in the seabed sediments.
Berthing pocket	Area of seabed at a berth that is deeper than the surrounding seabed to allow vessels to berth. Created by dredging material or by stirring up the sediment with the vessels' props.
Best Available Techniques (BAT)	The latest stage of development (state of the art) of processes, facilities or methods of operation, which indicate the practical suitability of a particular measure for limiting discharges, emissions or waste. Definition of 'available' includes demonstrated techniques, timescales as well as economic considerations. 'Techniques' include both the technology used and the way in which the field is designed, built, maintained, operated and dismantled.
Best Practicable Environmental Option	The option that offers most benefits and least damage to the environment within technical means, at acceptable cost in the long and short-term.
Biodiversity	The diversity of plant and animal life. Diversity is the measure of the variety of species contained within a habitat.
Biogenic	Produced by a living organism.
Bioturbation	The mixing of sediments or particles by fauna.
Black water	Sewage.
Block	Division of the FICZ / FOCZ into units. A Block is a subdivision of a Quadrant. There are 30 Blocks within one Quadrant. Block 14/05 is the 5th Block in Quadrant 14.
Blow-out	When the subsurface pressure in a well is greater than the pressure being applied from the rig or platform and there is an uncontrolled release of oil or gas into the wellbore and sometimes to the surface, wellbore or casing.
Blow-out preventer (BOP)	Hydraulically operated device placed on top of each well at the seabed to prevent uncontrolled releases of reservoir fluids from a well.
Casing	Large-diameter pipe lowered into the well and cemented into place to protect the well structure.
Clean-up	After a well has been drilled the drilling chemicals and rock in the hole will be flowed back to the rig or FPSO, this is known as cleaning up the well.
Completion	Preparing the well for production, including the assembly of downhole tubulars and equipment required to enable safe and efficient production from the well.
Conductor	The conductor extends from the drilling deck to the seabed and provides a guide and access to the well. It is sealed to enable circulation of drilling fluids.

Acronym / Term	Definition
Cuttings pile	A pile formed on the seabed as a result of the deposition of cuttings, which are produced whilst drilling the well.
Decommissioning	Shutdown of the Development including system cleaning and dismantling of facilities.
Define (FEED)	The process of developing the design of the project to the point where it can be passed onto a yard to start building.
Demersal	Living or occurring in the water at the bottom of a water body.
Demulsifier	A chemical used to break down crude-oil water emulsions. The chemical reduces the surface tension of the film of oil surrounding the droplets of water. The water then settles to the bottom of the tank.
Development well	Any well drilled in the course of extraction of reservoir hydrocarbons, whether specifically a production well or injection well.
Displace (a well)	The act of removing one fluid (usually liquid) from a wellbore and replacing it with another.
Drilling	The mechanical process where a wellbore is drilled from an offshore rig into the seabed to access the underground reservoir below.
Drill cuttings	Chips and small fragments of rock generated while drilling a well, which are brought to the surface by the flow of the drilling mud being circulated.
Drilling mud	Special clay, water and chemical additives pumped downhole through the drill pipe and drill bit. The mud cools the rapidly rotating bit, lubricates the drill pipe as it turns in the well bore, carries rock cuttings to the surface and serves as a plaster to prevent the wall of the borehole from collapsing.
Drill string	Lengths of steel tubing roughly 10 m long screwed together to form a pipe connecting the drill bit to the rig. It is rotated to drill the hole and delivers the drilling fluids to the cutting edge of the drill bit.
Duty of Care	This is a requirement that a person / organisation act towards others and the public with watchfulness, attention, caution and prudence that a reasonable person / organisation in the circumstances would. If a person's / organisation's actions do not meet this standard of care then the acts are considered negligent and any damages resulting may be claimed in a lawsuit for negligence.
Dynamic positioning	Use of thrusters, instead of anchors, to maintain the position of a vessel.
Echolocation	The locating of objects using reflected sound.
Ecosystem	Consists of all the organisms living, including non-living physical components of the environment, with which they interact – a biological community and its environment.
Endemic	Native to or confined to a particular region.
Environmental Impact Assessment	Process to identify and assess the impacts associated with a particular activity or plan.
Environmental Impact Statement	Document detailing the environmental impact assessment process.
Environmental Monitoring and Management Plan (EMMP)	Based on the findings of the EIS, this document, or set of documents sets out how the company will manage and monitor their environmental impacts. It includes, for example, surveys, research and monitoring of emissions.
Epifauna	Benthic organisms that inhabit the surface of the seabed.
E-Rep	Voluntary environmental representative who works offshore, responsibilities include checking waste consignments, performing

Acronym / Term	Definition
	audits on, for example, environmentally critical valves to ensure they are in the correct position.
Exclusion zone	An area where access is restricted or prohibited and where specific safety measures or protocols are in place to minimize risk or hazards.
First-Oil	First production of hydrocarbons from the reservoir to the FPSO
Flare	On the MODU and FPSO, a vent for burning unwanted gases or to burn off hydrocarbons which, due to temporary malfunction of maintenance of process plant, cannot be safely stored or retained in the process vessels.
Floating Production, Storage and Offloading vessel (FPSO)	The ship-shaped vessel used to produce the oil from the field, remaining in place offshore for the full Field Life.
Flow assurance	The various methods (heating, chemicals) used to keep the oil flowing through the flowlines offshore.
Flowline	Pipe laid on the seabed for the transportation of production or injection fluids. It links the subsea structures together or to the FPSO. Its length can range from a few hundred metres to a few kilometres.
Gas blanket	Inert gas used to cover liquid hydrocarbons in a tank to prevent ignition by removing oxygen from the atmosphere
Gas production / injection well	A well that can either produce gas from the reservoir to the FPSO or inject gas from the FPSO into the reservoir.
Gas lift	Adding reservoir gas into the well at the seabed to mix with the oil that is flowing to the surface to help move the oil from the seabed to the FPSO.
GIIP	Gas Initially In Place, the volume of gas in a reservoir before production.
Graben	Depressed block of land bordered by parallel faults.
Greenhouse gas	Gases in the atmosphere that absorbs and emit radiation within the thermal infrared range.
Grey water	Wastewater from kitchens, showers and sinks.
Hawser	A thick rope tied between two vessels used to moor or tow a vessel
Hook up and commissioning	The process of connecting up all the offshore pipelines, FPSO, wells etc. before production can commence. This also includes testing all the connections to make sure they are sound.
Hydrates	Crystalline solids composed of gas molecules trapped inside water molecules. They are stable at low temperatures and relatively high pressures. Once hydrocarbon hydrates are formed they can plug pipelines, which can affect production.
Hydrotest	A pressure test using water, sometimes dosed with chemicals.
Inert gas	A non-reactive gas.
Inshore transfer	The process to transferring oil from one vessel to another in an enclosed bay.
Intervention	The downhole re-entry of a well inside the existing completion equipment.
Jumper	A short flexible or rigid pipe used to connect a flowline to a subsea structure or two subsea structures close to each other.
Manifold	An area that contains all the valves for controlling the incoming and outgoing streams.
Mattress	A structure to support and protect subsea structures during installation and pre-commissioning activities and to provide dropped object protection to flowlines.
Migration	Any regular animal journey along well-defined routes, particularly those involving a return to breeding grounds.

Acronym / Term	Definition
Mitigation	Process, activity or piece of equipment that would make a consequence less severe.
Mobile Offshore Drilling Unit (MODU)	Also called a 'rig'. The MODU is only in field to drill the wells, it will then move to another job elsewhere.
Mud	This is generally synonymous with drilling fluid and encompasses most fluids used in hydrocarbon drilling operations, especially fluids that contain significant amounts of suspended solids, emulsified water or oil.
Open Hole Gravel Pack	A type of sand-control well completion in which the gravel pack screen is packed off in an open hole section with no casing or liner to support the producing formation. The open hole interval is often prepared by underreaming a section of reservoir below the last casing shoe. As OHGP do not require the use of explosives to perforate the well, there is very little debris downhole and wells require no clean-up operation after completion.
P50 reserves	Probable reserves for recovery.
Pelagic	Referring to the water column and the organisms living therein.
Petrogenic	Of hydrocarbon origin.
Photic zone	The upper water column which receives enough light for photosynthesis to occur.
Physio-chemical	Parameters such as temperature, nutrients or chemicals.
Phytoplankton	Microscopic planktonic plants such as diatoms and dinoflagellates.
Piling	Tubular steel shafts driven into the seabed to anchor a structure.
Plankton	Tiny plants and animals that drift in the surface water of seas and lakes. Of great economic and ecological importance as they are a major component of the marine food chain.
Polychaete	Bristle worms. Segmented worms, generally marine.
Produced water	Water that is produced from the reservoir along with oil and gas.
Production packer	A device used to isolate the annulus of the well and anchor or secure the bottom of the production tubing string.
Production well	A well drilled to produce hydrocarbons from the reservoir back to the FPSO.
Project sanction	When Navitas decide to commit spending to start building the infrastructure for the project. 'Project sanction' may also refer to a decision by FIG to approve the project. The two are often simultaneous.
Project-specific mitigation	Mitigations that are over and above the standard mitigations used by the Oil and Gas industry
Pyrogenic	Produced under conditions involving intense heat.
Ramsar site	Statutory areas designated under the Ramsar convention (the Convention on Wetlands of International Importance), especially as waterfowl habitat.
Recruitment	Young fish joining the main adult fish population.
Reservoir	A porous, permeable sedimentary rock formation containing oil and / or gas enclosed or surrounded by layers of less permeable or impervious rock – a structural trap.
Riser	Also known as a 'marine riser'. A pipe that goes from the seabed to the surface and is used to transfer produced fluids (oil, water and gas). Risers may be flexible or rigid.
Seawater sweeps	Drilling fluid which uses seawater as the bulk fluid for drilling the top sections of a well.

Acronym / Term	Definition
Separator	A pressure vessel used to separate reservoir fluids into gas and liquid components with the aid of chemicals and heat.
Sessile	An organism that is attached to another structure by its base and is unable to move freely.
Sidetrack	A directional hole drilled in a well to bypass an obstruction in the well that cannot be removed or damage, such as collapsed casing that cannot be repaired. Sidetracking may also be done to deepen a well or relocate the bottom of the well to a more productive zone.
Simultaneous Operations (SIMOPS)	The time when the rig is drilling wells whilst the FPSO is producing oil from the reservoir.
Social Impact Assessment	A impact of the social impact the project may have on the community. This looks at things like access to healthcare and schools. This is submitted separately to the EIS.
Spud / spudding	Starting to drill a well.
Stakeholder	Any individual or groups of people who are affected by or have interest in, the activities and / or outcome of the Development.
Stock-Tank Oil Initially in Place (STOIIP)	The volume of oil in a reservoir prior to production.
Suction anchor	Anchor that is partly hollow inside. When installed the hollow part of the suction anchor sinks into the seabed. The suction anchor is then closed, creating a vacuum inside the anchor.
Suezmax	A large tanker which, historically, was able to fit through the Suez canal. Now defined by the size range: max. beam 77.5m, max. height 68m, max. draft 20.1 m, unlimited length.
Topsides	The equipment situated on a platform (such as an FPSO) including the oil production plant and accommodation block.
Trophic	Relates to feeding.
Tubing hanger	A device attached to the topmost tubing joint in the wellhead to support the tubing string.
Umbilical	Any of various lines transmitting electricity or fluids to one portion of a system or between systems subsea.
Vapour recovery / vapour balancing	When vapour (fumes) is prevented from release to the atmosphere (recovery) often by transferring it to another vessel (vapour balancing).
Venting	Discharge of unwanted, un-burnt gases or hydrocarbons which, due to temporary malfunction or maintenance of process plant, cannot be safely stored or retained in process vessels.
Viscosity	The resistance of flow of a liquid.
Water injection well	A well for flowing water into the reservoir to provide support to the reservoir and to 'push' the oil in the rock towards the oil producing wells.
Wellhead	A top of casing and the attached control and flow valves. The wellhead is where the control valves, testing equipment and take-off pipe are located.
Workover	A maintenance job on a well, usually to replace equipment or stimulate production.
X-mas tree	The assembly of valves and fittings on the seabed at each well to control and monitor the flow from the reservoir.
Zooplankton	Animals that drift in the plankton, mostly microscopic.
Anthropogenic	Relating to human activities, or man-made

APPENDIX 1 INTERNATIONAL UNION FOR THE CONSERVATION OF NATURE (IUCN) THREAT CATEGORIES

The IUCN (2024) Red List Categories and Criteria are a widely understood system for classifying species at risk of global extinction. The criteria can be applied to any taxonomic unit at or below the species level (known as a 'taxon'). A listing in a higher extinction risk category (see Figure 1) implies a higher expectation of extinction, and over the time-frames specified more taxa listed in a higher category are expected to go extinct than those in a lower one.

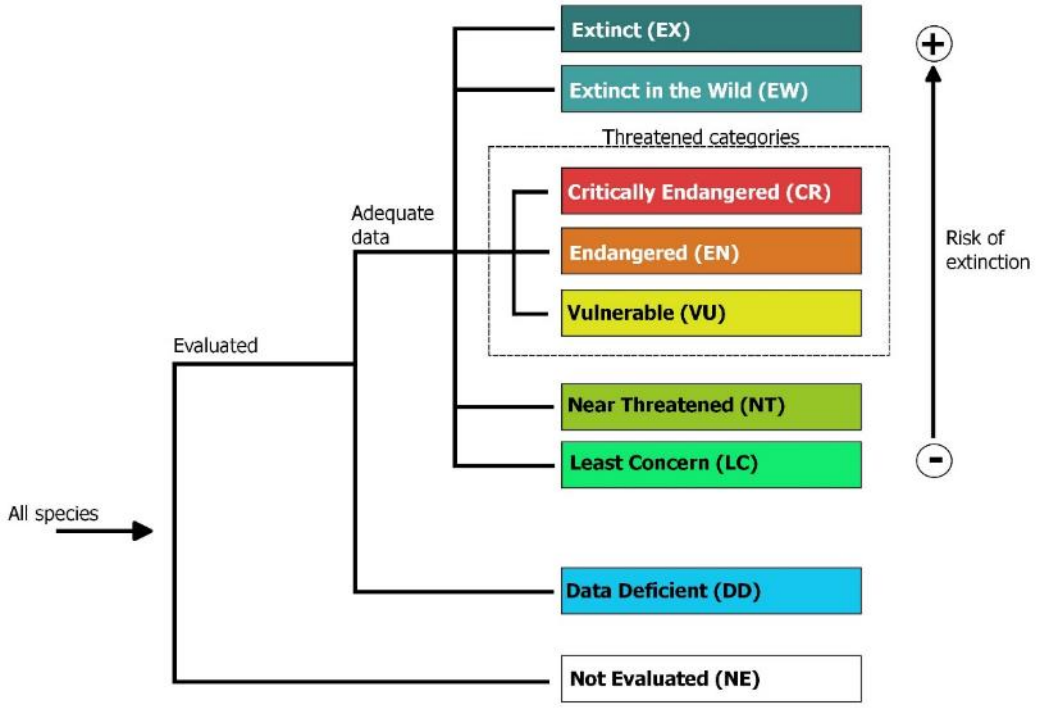

Figure 1: The relationship between the IUCN Red List Categories

A1.1 IUCN Categories

A1.1.1 Extinct (EX)

A taxon is Extinct when there is no reasonable doubt that the last individual has died. A taxon is presumed Extinct when exhaustive surveys in known and/or expected habitat, at appropriate times, throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form.

A1.1.2 Extinct in the Wild (EW)

A taxon is Extinct in the Wild when it is known only to survive in cultivation, in captivity or as a naturalised population well outside the historic range.

A1.1.3 Critically Endangered (CR)

A taxon is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered (Section 1.2), and it is therefore considered to be facing an extremely high risk of extinction in the wild.

A1.1.4 Endangered (EN)

A taxon is Endangered when the best available evidence indicates that it meets any of the criteria A to E for Endangered (Section 1.2), and it is therefore considered to be facing a very high risk of extinction in the wild.

A1.1.5 Vulnerable (VU)

A taxon is Vulnerable when the best available evidence indicates that it meets any of the criteria A to E for Vulnerable (Section 1.2), and it is therefore considered to be facing a high risk of extinction in the wild.

A1.1.6 Near Threatened (NT)

A taxon is Near Threatened when it has been evaluated against the criteria but does not qualify for Critically Endangered, Endangered or Vulnerable now, but is close to qualifying for or is likely to qualify for a threatened category in the near future.

A1.1.7 Least Concern (LC)

A taxon is Least Concern when it has been evaluated against the criteria and does not qualify for Critically Endangered, Endangered, Vulnerable or Near Threatened. Widespread and abundant taxa are included in this category.

A1.1.8 Data Deficient (DD)

A taxon is Data Deficient when there is inadequate information to make a direct, or indirect, assessment of its risk of extinction based on its distribution and/or population status. A taxon in this category may be well studied, and its biology well known, but appropriate data on abundance and/or distribution are lacking. Data Deficient is therefore not a category of threat. Listing of taxa in this category indicates that more information is required and acknowledges the possibility that future research will show that threatened classification is appropriate.

A1.1.9 Not Evaluated (NE)

A taxon is Not Evaluated when it has not yet been evaluated against the criteria.

A1.2 IUCN threat criteria for Critically Endangered, Endangered and Vulnerable taxa

A taxon is assigned to a particular threat category if it meets one or more of the criteria associated with that category. The criteria for each threat category are based on the following:

- Reduction in population size over a set time period or three generations,
- Geographical range,
- Overall population size, and
- Quantitative analysis of the probability of extinction in the wild.

Further details concerning the criteria and how they relate to each of the threatened categories can be found on the IUCN website (https://www.iucnredlist.org/resources/summary-sheet).

A1.3 Falkland Islands species and their IUCN status

The species of bird and marine mammal mentioned in the Environmental Impact Statement (EIS) are listed in Tables A1.1 and A1.2 respectively. The species codes refer to those used in Chapter 7 of the EIS. The IUCN status for each species was correct as of October 2024.

Table A1-1: Bird species mentioned in the ES text with current IUCN status

Species code	Common name	Scientific name	IUCN status October 2024
AF	Antarctic fulmar	*Fulmarus glacialoides*	LC
AS	Antarctic skua	*Catharacta antarctica*	LC
AtP	Atlantic petrel	*Pterodroma incerta*	EN
BBSP	Black-bellied storm-petrel	*Fregetta tropica*	LC
BBA	Black-browed albatross	*Thalassarche melanophris*	LC
	Black-chinned siskin	*Spinus barbatus*	LC
	Blackish oystercatcher	*Haematopus ater*	LC
	Black-throated finch	*Melanodera melanodera*	LC
BP	Blue petrel	*Halobaena caerulea*	LC
BHG	Brown-hooded gull	*Larus maculipennis*	LC
CP	Cape petrel	*Daption capense*	LC
	Chiloe wigeon	*Mareca sibilatrix*	LC
CW	Cobb's wren	*Troglodytes cobbi*	LC
	Crested caracara	*Caracara plancus*	LC
	Dark-crowned night heron	*Nycticorax nycticorax*	LC
	Dark-faced ground-tyrant	*Muscisaxicola maclovianus*	LC
Dio Alb	Diomedea albatross species	*Diomedea* spp.	EN
DP	Diving-petrel species	*Pelecanoides* spp.	LC
DG	Dolphin gull	*Larus scoresbii*	LC
	Falkland pipit	*Anthus correndera*	LC
FSD	Falkland steamer duck	*Tachyeres brachypterus*	LC
	Falklands thrush	*Turdus falcklandii*	LC
GP	Gentoo penguin	*Pygoscelis papua*	LC
GPsp	Giant petrel species	*Macronectes* spp.	LC
	Grass wren	*Cistothorus platensis*	LC
GS	Great shearwater	*Ardenna gravis*	LC
GrP	Grey petrel	*Procellaria cinerea*	NT
GBSP	Grey-backed storm-petrel	*Garrodia nereis*	LC
GHA	Grey-headed albatross	*Thalassarche chrysostoma*	EN
	House sparrow	*Passer domesticus*	LC
IS	Imperial shag	*Leucocarbo atriceps*	LC
Kgo	Kelp goose	*Chloephaga hybrida*	LC
KG	Kelp gull	*Larus dominicanus*	LC
KeP	Kerguelen petrel	*Aphrodroma brevirostris*	LC
KP	King penguin	*Aptenodytes patagonicus*	LC
	Least seed snipe	*Thinocorus rumicivorus*	LC
LMSA	Light-mantled sooty albatross	*Phoebetria palpebrata*	NT
LS	Little shearwater	*Puffinus assimilis*	LC
	Long-tailed meadow lark	*Sturnella loyca*	LC

Species code	Common name	Scientific name	IUCN status October 2024
LTS	Long-tailed skua	*Stercorarius longicaudus*	LC
MDP	Magellan diving-petrel	*Pelecanoides magellani*	LC
	Magellanic oystercatcher	*Haematopus leucopodus*	LC
MP	Magellanic penguin	*Spheniscus magellanicus*	LC
	Magellanic snipe	*Gallinago magellanica*	LC
NGP	Northern giant petrel	*Macronectes halli*	LC
NRA	Northern royal albatross	*Diomedea sanfordi*	EN
PCD	Patagonian crested duck	*Lophonetta specularioides*	LC
	Peregrine falcon	*Falco peregrinus*	LC
Pr	Prion species	*Pachyptila* spp.	LC
	Red-backed hawk	*Buteo polyosoma*	LC
RS	Rock shag	*Leucocarbo magellanicus*	LC
R/M	Rockhopper / macaroni penguin	*Eudyptes* spp.	VU
RP	Rockhopper penguin	*Eudyptes chrysocome*	VU
	Ruddy-headed goose	*Chloephaga rubidiceps*	LC
	Rufous-chested dotterel	*Charadrius modestus*	LC
	Sanderling	*Calidris alba*	LC
	Sheathbill	*Chionis albus*	LC
	Silver teal	*Anas versicolor*	LC
SPP	Soft-plumaged petrel	*Pterodroma mollis*	LC
SS	Sooty shearwater	*Ardenna grisea*	NT
SAT	South American tern	*Sterna hirundinacea*	LC
SGP	Southern giant petrel	*Macronectes giganteus*	LC
SRA	Southern royal albatross	*Diomedea epomophora*	VU
	Speckled teal	*Anas flavirostris*	LC
	Turkey vulture	*Cathartes aura*	LC
TB	Tussac bird (blackish cinclodes)	*Cinclodes antarcticus*	NT
	Two-banded plover	*Charadrius falklandicus*	LC
	Upland goose	*Chloephaga picta*	LC
WA	Wandering albatross	*Diomedea exulans*	VU
WCP	White-chinned petrel	*Procellaria aequinoctialis*	VU
	White-rumped sandpiper	*Calidris fuscicollis*	LC
	White-tufted grebe	*Rollandia rolland*	LC
WP	Wilson's storm-petrel	*Oceanites oceanicus*	LC
	Yellow-billed pintail	*Anas georgica*	LC

South American fur seal	*Arctocephalus australis*	LC
Antarctic fur seal	*Arctocephalus gazella*	LC
South American sea lion	*Otaria flavescens*	LC

APPENDIX 2 COMPLIANCE EVALUATION AGAINST SCHEDULE 4

Table A2-1 cross references the Requirements of the Offshore Minerals (Amendment) Ordinance 2011 Schedule 4 with the Offshore component of The Sea Lion Field Northern Area Development, Phase 1 & 2.

Table A2-1: Schedule 4 requirements and the Phase 1 & 2 Development

Offshore Minerals (Amendment) Ordinance 2011		Notes	Location of information within the EIS
Schedule 4			
Sub-Para	Requirement		Chapter / Section[101]
Paragraph 2: Project Description			
1	Description of the project to which the EIS relates	An overview of the project is provided in the NTS (Chapter 1) and in the main EIS Introduction (Chapter 2). A similar summary of the project, followed by full details are provided in the Development Description (Chapter 5). Further presentation of project details is provided in each Impact and Risk assessment Chapter where it is considered necessary for quantification.	Chapter 1 Chapter 2 Chapter 5
2	Detail on location, design and size	• Detail on the location of the Sea Lion Drill Centres (DCs) is provided in Section 5.4.1 and Section 5.8 of the Development Description and detail on the number of wells and drilling design is in Sections 5.4.4 and 5.4.5 respectively. • The location of the FPSO is in Section 5.5.4 and the design of the unit is described in Section 5.8.2 to Section 5.8.6. • Detail on the location and scale of inshore operations is provided in Section 5.5. Detail on the crude oil export facilities and process is provided in Section 5.10. • Detail on the onshore base facilities is provided in Section 5.11.1.	Section 5.4.1 Section 5.4.4 Section 5.4.5 Section 5.5.4 Section 5.8.2 Section 5.8.3 Section 5.8.4 Section 5.8.5 Section 5.8.6 Section 5.5 Section 5.10 Section 5.11.1
4a	Land and seabed use requirements during the operational phase	**Detail on the equipment on the seabed is provided in:** • MODU anchors – Section 5.4.3.1. • FPSO anchors – Section 5.5.2. • Subsea production systems – Section 5.5.3. • Inshore anchorage – Section 5.5.1. • The location of the existing Temporary Dock Facility (TDF) is provided in Section 5.11.1.1.1.	Section 5.4.3.1 Section 5.5.2 Section 5.5.3 Section 5.5.1 Section 5.11.1.1.1 Section 5.11.1.1.2 Section 5.11.4.1.1

[101] Please note that the 'X's are intended as wildcards where numerous sections within the document are being referred to e.g., 10.1.4, and 10.5.4 etc.

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
		• The land use requirements with regard to the proposed and anticipated dimensions of the onshore supply base are described in Section 5.11.1.2. • The potential for development of temporary accommodation units is described in Section 5.11.4.1.1. Land use with regard to the forecasted use of roads is estimated in Section 11.7.4.4. • The area of seabed likely to be used offshore for the DCs, all flowlines, and the MODU/FPSO moorings, as well as the seabed used in Berkeley Sound for the LTV anchorage is quantified in the Disturbance to the Seabed Chapter 10.3.4.3. • The area of seabed that may be 'used' by discharged drill cuttings is quantified in Section 10.6.4.3.4.1. The fact that land may be used around the coast in the event of an oil spill necessitating the development of lined storage space for oil spill wastes, is described in Section 10.10.2.2.3. **Acknowledged uncertainties:** • The area (and location) of the temporary accommodation units is as yet unknown. It is not possible to credibly estimate the area of land that may be required for the temporary storage of oil spill waste.	Section 11.7.4.4 Section 10.3.4.3 Section 10.6.4.3.4.1 Section 10.10.2.2.3
4b	The nature and quantity of materials used	**Detail on the chemicals that may be required for the:** • Drilling mud are provided in Section 5.4.5.3. • Cement is provided in Section 5.4.6.2. • Drilling chemical use and discharge in Section 5.4.6. • Production operations are provided in Section 5.9.1. • Detail on the potential for the use of explosives is described in Section 5.4.7. • Detail on the need for diesel is provided in Sections 5.8.2.3 (fuel combustion equipment) and 5.8.3.3. • Detail on the volumes of associated gas that may be used as fuel gas is provided in Section 5.8.4.3. • Detail on the assumption made with regard to fuel use are provided in Section 10.9.4.4.1 • Detail on the diesel and fuel gas consumption rates is provided in Section 10.9.4.4.2. **Use of 'materials' in terms of finite local resources:** **Detail on the need for the use of finite 'materials' is provided in the Development Description Chapter as follows:**	Section 5.4.5.3 Section 5.4.6.2 Section 5.4.6 Section 5.9.1 Section 5.4.7 Sections 5.8.2.3 Section 5.8.3.3 Section 5.8.4.3 Section 10.9.4.4.1 Section 10.9.4.4.2

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
		• Accommodation: Section 5.11.4.1. • Water: Section 5.11.4.2. • Electricity: Section 5.11.4.3. • Potential for use of commercial flights: Section 5.11.3.1.1 **Quantification of the use of finite materials in provided in the following Impact and Risk Assessment Chapters:** • Accommodation: Section 11.3.4.2 (in terms of whether existing accommodation is sufficient to meet Navitas requirements). • Water: Section 11.4.4.2.3. • Electricity: Section 11.5.4.2. • Use of airlinks: Section 11.6.4.1. • Use of roads: Section 11.7.4.4. **Acknowledged uncertainties:** • It is acknowledged that the current baseline of water and power availability in the Falklands may change depending upon future developments. • Potential for use of commercial flights: Section 5.11.3.1.1.	Section 5.11.4.1 Section 5.11.4.2 Section 5.11.4.3 Section 5.11.3.1 Section 11.3.4.2 Section 5.11.3.1.1 Section 11.4.4.2.3 Section 11.5.4.2 Section 11.6.4.1 Section 11.7.4.4
4c	Estimation of the type and quantity of residues and emissions resulting from the operation of the project:	• The type and quantity of residues / emissions and other outputs is quantified within the 'Characterisation and Quantification of the Nature of the Impact / Risk' section in each Impact / Risk Chapter. However, they are also summarised in Section 5.14 of the Development Description. **Acknowledged uncertainties / data gaps:** • When forecasting the outputs from the project that may impact upon the environmental and social receptors, it is acknowledged that these are predictions and a precautionary approach is taken throughout the assessment to ensure that the maximum credible residue or emission is assumed. The use of a precautionary approach is described, as necessary, in each chapter, and a final confidence rating is assigned within Section X.X.10 of each Impact / Risk Assessment Chapter.	Sections X.X.4[1] in Chapters 10, 11 and 12 Section 5.15 Sections X.X.10 in Chapters 10, 11 and 12

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
4c	Water quality	**The residues that may impact upon water quality are detailed within the characterisation and quantification sections of the:** • Drilling muds and cuttings Chapter, Section 10.6.4.1.3 (mud composition) and Section 10.6.4.3 (dispersion modelling). • Operational Discharges Chapter, Section 10.7.4.1 (regarding composition of discharges) and Section 10.7.4.5 (dispersion modelling). • Thermal discharges Chapter, Section 10.8.4.3.3. • Atmospheric Emissions Chapter, Section 10.9.4.2 (with regard to Impacts of CO_2 on ocean acidification and acid deposition). **The residues to water that may result from oil spills are estimated in the Characterisation and Quantification sections of the:** • Oil spill offshore Chapter, Section 12.1.4.3 (oil spill modelling regarding spill volumes and trajectories). • Oil spill inshore Chapter, Section 12.2.4.3 (oil spill modelling regarding spill volumes and trajectories). • Oil spill at-shore Chapter, Section 12.3.4.1 (regarding the types of fluids that may be spilled).	Section 10.6.4.1.3 Section 10.6.4.3 Section 10.7.4.1 Section 10.7.4.5 Section 10.8.4.3.3 Section 10.9.4.2 Section 12.1.4.3 Section 12.2.4.3 Section 12.3.4.1
	Air quality	**The emissions that may Impact upon the global climate are detailed within the Characterisation and Quantification sections of the:** • Atmospheric emissions Chapter, Section 10.9.4.4 (regarding forecast emissions).	Section 10.9.4.4
	Soil quality	**The residues and emissions that may impact upon soil quality and the global climate are detailed within the Characterisation and Quantification sections of the:** • Atmospheric emissions Chapter, Section 10.9.4.5 (with regard to acid deposition).	Section 10.9.4.4.6
	Noise	**The noise emissions are detailed within the Characterisation and Quantification sections of the:** • Disturbance to wildlife from helicopter noise Chapter, Section 10.2.4.2 (regarding estimated helicopter noise exposure). • Underwater noise offshore Chapter, Section 10.4.4.4 (noise modelling). • Under water noise inshore Chapter, Section 10.5.4.4 (noise modelling).	Section 10.2.4.2 Section 10.4.4.5 Section 10.5.4.4 Section 11.9.4.3 Section 11.9.4.4

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	**Requirement**		**Chapter / Section[101]**
		• Disturbance to human population from helicopters and noise Chapter, Section 11.9.4.3 (regarding estimated helicopter noise exposure) and Section 11.9.4.4 (regarding exposure to other noise sources).	
	Light	**The emissions of artificial light are detailed within the Characterisation and Quantification sections of the:** • Artificial light Chapter, Section 10.1.4.1 (regarding light levels). Disturbance to human population from light Chapter, Section 11.8.4.2 (regarding light levels).	Section 10.1.4.1 Section 11.8.4.2
	Waste	• **The residues and emissions associated with waste are detailed within the Characterisation and Quantification sections of the:** Waste Chapter, Section 10.10.4.4 (regarding waste estimates).	Section 10.10.4.4
Paragraph 2: Measures to protect the environment			
(2a,b,c)	Information on mitigation measures to eliminate or reduce, remedy or offset environmental Impacts to/from:	Information on the mitigation hierarchy and the types of mitigations that are applied within the EIA are described in Section 8.7 of the EIA methodology Chapter. The mitigations that are built-in to the basis of the project design (i.e., the base-case mitigations) in order to minimise or eliminate residue or emission outputs (thus reducing impacts) are described throughout the Development Description and summarised in Section 5.13. **Note:** where it was deemed appropriate, the base-case mitigations are re-iterated in the relevant Chapter as they reduce the forecasted residue / emission / output. The industry-standard mitigations, and the project-specific mitigations (which are applied where necessary), are itemised within each Impact / Risk Assessment Chapter, as itemised below. With regard to offsetting measures specifically, these are described in Section 8.11 and noted throughout the assessment chapters in Sections X.X.11.	Section 8.7 Section 5.13 Section 8.11 Section X.X.11 in Chapters 10, 11 and 12
	Water quality	**The industry-standard and project-specific mitigations that apply to Impacts on water quality are described in the following:** • Drilling muds and cuttings Chapter, Section 10.6.5 & Section 10.6.7. • Operational Discharges Chapter, Section 10.7.5 & Section 10.7.7. • Thermal discharges Chapter, Section 10.8.5 & Section 10.8.7.	Sections 10.6.5 & 10.6.7 Sections 10.7.5 & 10.7.7 Sections 10.8.5 & 10.8.7 Sections 10.9.5 & 10.9.7 Sections 12.1.5 & 12.2.7

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
		• Atmospheric Emissions Chapter, Section 10.9.5 & Section 10.9.7 (with regard to reducing emissions to lessen the impacts on ocean acidification). • Oil spill offshore Chapter, Section 12.1.5 & Section 12.1.7. • Oil spill inshore Chapter, Section 12.2.5 & Section 12.2.7. • Oil spill at-shore Chapter, Section 12.3.5 & Section 12.3.7.	Sections 12.2.5 & 12.2.7 Sections 12.3.5 & 12.3.7
	Air quality	**The industry-standard and project-specific mitigations that apply to Impacts on air quality and global emissions are described in the following:** • Atmospheric Emissions Chapter, Section 10.9.5 & Section 10.9.7.	Sections 10.9.5 & 10.9.7
	Soil quality	**The industry-standard and project-specific mitigations that apply to Impacts on soil / sediment (including seabed) quality are described in the following:** • Drilling Mud and Cuttings Chapter, Section 10.6.5 & Section 10.6.7. • Atmospheric emissions Chapter, Section 10.9.5 & Section 10.9.7 (with regard to reducing emissions to lessen the impacts of acid deposition).	Sections 10.6.5 & 10.6.7 Sections 10.9.5 & 10.9.7
	Noise	**The industry-standard and project-specific mitigations that apply to noise generation are described in the following:** • Disturbance to wildlife from helicopter noise Chapter, Section 10.2.5 & Section 10.2.7. • Underwater noise offshore Chapter, Section 10.4.5 & Section 10.4.7. • Under water noise inshore Chapter, Section 10.5.5 & Section 10.5.7. • Disturbance to human population from helicopters and noise Chapter, Section 11.9.5 & Section 11.9.7.	Sections 10.2.5 & 10.2.7 Sections 10.4.5 & 10.4.7 Sections 0 & 10.5.7 Sections 11.9.5 & 11.9.7
	Light	**The industry-standard and project-specific mitigations that apply to light generation are described in the following:** • Artificial light Chapter, Section 10.1.5 & Section 10.1.7. • Disturbance to human population from light Chapter, Section 11.8.5 & Section 11.8.7.	Sections 10.1.5 & 10.1.7 Sections 11.8.5 & 11.8.7
	Waste	**The industry-standard and project-specific mitigations that apply to waste generation are described in the following:** • Waste Chapter, Section 10.10.5 & Section 10.10.7.	Sections 10.10.5 & 10.10.7
Paragraph 3: Requirement for data			

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
		As explained in Section 2.5.1, (Table 8) each Impact / Risk Assessment Chapter draws on (and references) data from the: • Development Description (Chapter 5) to enable quantification / estimation of residues, emissions and other outputs associated with the project activities. • Subject-matter literature reviews used to ensure understanding of the nature of the impact. Environmental Baseline Chapter (Chapter 7) to enable understanding of the nature of the impact when assessing the 'sensitivity of the receptor' and the 'severity of effect' in the Falklands Islands specifically. **Acknowledged uncertainties / Data Gaps:** • Known uncertainties in the project design are listed in Section 2.2.4 and where these exist, the credible worst-case is always assumed to ensure that impact assessments are of the highest level of residue / emission / other outputs. • Uncertainties within the project design are expounded upon further in the Development Description (Chapter 5). • Uncertainties within the literature are discussed within the Characterising and Quantification Sections of each Impact / Risk Assessment Chapter. • Known data gaps within the Environmental Baseline are identified in Section 7.2.4. • A precautionary approach is taken throughout each Impact / Risk Assessment and the overall Confidence in the data used for each assessment is assigned a score in Section X.X.10 of each Impact / Risk Chapter.	Sections 2.5.1 Chapter 5 Chapter 7 Section 2.2.4 Section 7.2.42.2.4 Section X.X.10 in Chapters 10, 11 and 12
	Water	**The data and background information required to identify and assess the impacts on water quality is provided in:** • Drilling muds and cuttings Chapter, Section 10.6.4. • Operational Discharges Chapter, Section 10.7.4. • Thermal discharges Chapter, Section 10.8.4. • Atmospheric Emissions Chapter, Section 10.9.4 (with regard to Impacts on ocean acidification). • Oil spill offshore Chapter, Section 12.1.4. • Oil spill inshore Chapter, Section 12.2.4. • Oil spill at-shore Chapter, Section 12.3.4.	Section 10.6.4 Section 10.7.4 Section □ Section 10.9.4 Section 12.1.4 Section 12.2.4 Section 12.3.4

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
	Air quality	**The data and background information required to identify and assess the impacts on air quality and global emissions is provided in:** • Atmospheric emissions Chapter, Section 10.9.4.	Section 10.9.4
	Soil quality	**The data and background information required to identify and assess the impacts on soil / sediment (including seabed) quality is provided in:** • Drilling Mud and Cuttings Chapter, Section 10.6.4. • Atmospheric Emissions Chapter, Section 10.9.4 (with regard to quantifying acid deposition).	Section 10.6.4 Section 10.9.4
	Noise	**The data and background information required to identify and assess the impacts of noise generation is provided in:** • Disturbance to wildlife from helicopter noise Chapter, Section 10.2.4. • Underwater noise offshore Chapter, Section 10.4.4. • Under water noise inshore Chapter, Section 10.5.4. • Disturbance to human population from helicopters and noise Chapter, Section 11.9.4.	Section 10.2.4 Section 10.4.4 Section 10.5.4 Section 11.9.4
	Light	**The data and background information required to identify and assess the impacts of light generation is provided in**: • Artificial Light Chapter, Section 10.1.4. • Disturbance to human population from light Chapter, Section 11.8.4.	Section 10.1.4 Section 11.8.4
	Waste	**The data and background information required to identify and assess the impacts of waste generation is provided in:** • Waste Chapter, Section 10.10.4.	Section 10.10.4
Paragraph 4 :Environmental effects			
2	Description of the specific aspects of the environment likely to be significantly	**The following chapters demonstrate how the environment effects were identified and estimated:** • The EIA Methodology Chapter 8. • The Identification of Environmental Aspect and Impact Identification' and Screening which provides the outputs of the ENVIID workshop in Chapter 9. • The Environmental Baseline (Chapter 7) which describes the environmental and social aspects of the environment which may be affected.	Chapter 8 Chapter 9 Chapter 7 Section X.X.6 in Chapters 10, 11 and 12

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
	affected by the project	• The impact and risk assessments of each activity are described in Section X.X.6 of each assessment. **Acknowledged data gaps:** • It is recognised that data gaps still exist with regard to the baseline. These are acknowledged in Section 7.2.4, throughout the Impact / Risk Assessment Chapters in the Characterising and Quantifying sections (X.X.4) and in the Confidence section (X.X.10).	Section 7.2.4 Section X.X.4 in Chapters 10, 11 and 12 Section X.X.10 in Chapters 10, 11 and 12
2a	Human population	The social baseline is described in Section 7.7 of the Environmental baseline with the human population described specifically in Section 7.7.2.	Section 7.6.4 Section 7.7.2
2b	Flora	• Phytoplankton are described in Section 7.4.1.2 of the Environmental Baseline Chapter. • Marine and intertidal vegetation are described in Section 7.4.2. • Flora are also covered in the description of 'Threatened Terrestrial Habitats' in Section 7.5.3. • Protected terrestrial plant species are described in Section 7.5.1.5. • Important Plants Areas are described in Section 7.5.2.3.2. • Terrestrial Habitats surrounding Berkeley Sound in Section 7.5.2.4.	Section 7.4.1.2 Section 7.4.2 Section 7.5.3 Section 7.5.1.5 Section 7.5.2.4 Section 7.5.2.3.5
2c	Fauna	**Fauna are described in:** • Section 7.4.3 Benthic Environmental. • Section 7.4.4 Fish and Invertebrate Ecology. • Section 7.4.5 Seabirds and Seabird vulnerability. • Section 7.4.6 Marine mammals. **The conservation status of fauna is described in:** • Section 7.5.1.1 Benthic species. • Section 7.5.1.2 Fish species. • Section 7.5.1.3 Seabird species. • Section 7.5.1.4 Marine mammal species.	Section 7.4.3 Section 7.4.4 Section 7.4.5 Section 7.4.6 Section 7.5.1.1 Section 7.5.1.2 Section 7.5.1.3 Section 7.5.1.4
2d	Soil (including seabed and its subsoil)	Seabed sediments are described in Section 7.3.7 of the Environmental Baseline.	Section 7.3.7

Offshore Minerals (Amendment) Ordinance 2011		Notes	Location of information within the EIS
Schedule 4			
Sub-Para	Requirement		Chapter / Section[101]
2e	Water (including the sea)	• Water movements are described in Section 7.3.3 of the Environmental Baseline. • Details on background salinity is described in Section 10.7.4.1.5.	Section 7.3.3 Section 10.7.4.1.5
2f	Air	The global atmosphere is described in Section 7.3.1 of the Environmental Baseline. General detail on the meteorology of the area (wind speed, air temperature etc.) is provided in Section 7.3.2 of the Environmental Baseline.	Section 7.3.1 Section 7.3.2
(2g)	Climatic factors	The global atmosphere is described in Section 7.3.1 of the Environmental Baseline.	Section 7.3.1
(2h)	Landscape and seascape	Scenery, wildlife and tourism are described in Section 7.7.4.6 of the Environmental Baseline.	Section 7.7.4.6
(2i)	Tangible property	Tangible property is described in Section 7.7.4 of the Environmental Baseline.	Section 7.7.4
(2j)	Architectural and archaeological heritage	Architectural and archaeological heritage is described in Section 7.7.6 of the Environmental Baseline.	Section 7.7.6
(2k)	Interactions between these factors in any combination	• While impact interactions are touched upon in the relevant Impact / Risk Assessment Chapters, Chapter 13. provides a summary of all the varying interactions that may occur. • Cumulative impacts are described within each assessment chapter in X.X.9 of each assessment chapter.	Chapter 13 X.X.9 in Chapters 10, 11 and 12
3	Description of the likely significant effects on the environment arising from:	**As explained in Section 2.4.1, (Table 8) each Impact / Risk Assessment Chapter has a specific section which draws upon all the data provided in the Chapter thus far to:** • Assess the initial Impact and / or the Risk which is in Section X.X.6. • Assess the residual Impact and / or the Risk which is in Section X.X.8. • Assess the cumulative Impacts in Section X.X.9.	X.X.6, X.X.8 and X.X.9 in Chapters 10, 11 and 12
(3a)	The existence of the project	The NTS (Chapter 1) provides a user-friendly overview of the project and the associated impacts and risks There is not a single Chapter which impact assesses the existence of the project as the entire EIS aims to do this. However, Chapter 14 provides an overall summary of the EIS findings and details the significance of the Impacts / Risks and the confidence in the assessment.	Chapter 1 Chapter 14
(3b)	The use of natural resources	**The need for resource use is described in the Development Description as follows:** • Detail on the combustion equipment on the FPSO is provided in Section 5.8.2.3.	Section 5.8.2.3

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
		• Detail on the need for diesel is provided in Section 5.8.3.3. • Detail on the need for freshwater (and seawater) is provided in Section 5.8.3.5. Detail on the use of seawater is provided in Section 5.8.4.2 on heating and cooling systems and Section 5.8.5.8 on Water reinjection facilities. • Detail on the expected consumption of fuels is provided in the Atmospheric Emissions Chapter, Section 10.9.4.4.2 which estimates the planned emissions. • Detail on the expected freshwater use is provided in Section 11.4.4.2.3 which forecasts Phase 1 & 2 water usage.	Section 5.8.3.3 Section 5.8.3.5 Section 5.8.4.2 Section 5.8.5.8 Section 5.8.4.2 Section 11.4.4.2.3
(3c)	The emission of pollutants	**The emission of pollutants to air are described in:** • Atmospheric emissions Chapter, Section 10.9.6, Section 10.9.8 and Section 10.9.9.	Section 10.9
(3d)	The creation of nuisances by the project	**The Impacts upon the human population from nuisance factors are described in:** • Chapter 11.8 on Disturbance to the human population from light, Section 11.8.6 & Section 11.8.8 & Section 11.8.9. • Chapter 11.9 on Disturbance to the human population from helicopters and noise Section 11.9.6, Section 11.9.8 & Section 11.9.9.	Section 11.8 Section 11.9
(3e)	The elimination of waste	The Impacts of waste management in accordance with the waste hierarchy is described in: Chapter 10.10 on Waste Management, Section 10.10.6 & Section 10.10.8 & Section 10.10.9.	Sections 10.10.6, 10.10.8 & 10.10.9
Paragraph 5: Forecasting methods			
2	Details of the forecasting methods used to assess the effects of the project on the environment	**In order to carry out any Impact / Risk assessment, it is necessary to understand what the 'outputs' of the project may be e.g., how much CO_2, how much waste, noise etc. It is therefore necessary to forecast the data. Using data from the Development Description, and taking account of the base-case mitigations that are intended to reduce outputs, detail on the data quantification is provide in:** • Underwater noise offshore Chapter, Section 10.4.4.4. • Underwater noise inshore Chapter, Section 10.5.4.4. • Drill cuttings and mud Chapter, Section 10.6.4.3. • Discharges to Sea Chapter, Section 10.7.4.5.	Section 10.4.4.5 Section 10.5.4.4 Section 10.6.4.3 Section 10.7.4.5 Section 10.8.4.3.2 Section 10.9.4.4 Section 10.10.4.4 Section 10.11.4.4

Offshore Minerals (Amendment) Ordinance 2011		Notes	Location of information within the EIS
Schedule 4			
Sub-Para	Requirement		Chapter / Section[101]
		• Thermal discharges to sea Chapter, Section 10.8.4.3.2. • Atmospheric Emissions Chapter, Section 10.9.4.4. • Waste Management Chapter, Section 10.10.4.4. • Marine mammals collisions Chapter, Section 10.11.4.4 (with regard to forecasted vessel behaviour). • Terrestrial invasive species Chapter, Section 10.13.4.2 (with regard to forecasted cargo delivery routes). • Disturbance to other users offshore Chapter, Section 11.1.4, and onshore Chapter, Section 11.2.4 (with regard to forecasting vessel behaviour and modelling of collision Risks).	Section 10.13.4.2 Section 11.1.4 Section 11.2.4
2	Details of the forecasting methods used to assess the effects of the project on the environment	• **Resource competition:** Accommodation Chapter, Section 11.3.4.2.1 (with regard to forecasted accommodation requirement and provision). • Resource competition: Fresh potable water Chapter, Section 11.4.4.2.3 (with regard to forecasted local water supply usage). • **Resource competition:** Use of Electricity Chapter, Section 11.5.4.2.2 (with regard to forecasted energy use). • **Resource competition:** Air-links Chapter, Section 11.6.4.1 (with regard to forecasted Phase 1 & 2 transportation requirements). • **Resource competition:** Use of Roads Chapter, Section 11.7.4.5 (with regard to forecasted Phase 1 & 2 road usage). • Disturbance to the human population from Light Chapter, Section 11.8.4.2.2 (with regard to forecasted location, number of light sources etc.). • Disturbance to the human population from helicopters and noise Chapter, Section 11.9.4.3 and Section 11.9.4.4 (with regard to forecasting noise levels). • Oil Spill offshore Chapter, Section 12.1.4.3 (oil spill modelling). • Oil Spill inshore Chapter, Section 12.2.4.4 (oil spill modelling). • Oil Spill at-shore Chapter, Section 12.3.4.1 (with regard to forecasting spill scenarios). **Acknowledged uncertainties:**	Section 11.3.4.2.1 Section 11.4.4.2.3 Section 11.5.4.2.2 Section 11.6.4.1 Section 11.7.4.5 Section 11.8.4.2.2 Section 11.9.4.3 Section 11.9.4.4 Section 12.1.4.3 Section 12.2.4.4 Section 12.3.4.1

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
		• Where there was uncertainty regarding the project basis of design (e.g., the number of wells or duration of an activity), the worst-case forecast was used. Where different options had different impacts , both options were factored into the assessment.	
Paragraph 6: Remediation:			
	Description of the measures envisaged upon termination of the project to eliminate or reduce, remedy or offset environmental Impacts	The decommissioning of the project will be covered by a separate EIA, as described in Section 5.12. The need for remediation efforts will be determined based on the outcomes of monitoring. The detailed Navitas monitoring strategy was established during the Environmental Monitoring and Management Plan (EMMP) workshop. All monitoring requirements agreed by Navitas and FIG will be recorded and managed *via* the project-specific Phase 1 & 2 EMMP, an outline of which is included within the EIS in Chapter 15. Details on monitoring are also included within each assessment chapter in Section X.X.10.1.	Section 5.12 Chapter 15 Section X.X.10.1 in Chapters 10, 11 and 12
Paragraph 7: Alternatives			
	An outline of the main alternatives (if any) that were studied by the applicant and the reasons for their rejection / selection	A summary of the consideration of alternatives is provided in the NTS. Detail on the Consideration of Alternatives is provided in Chapter 4.	Chapter 1 Chapter 4
(7a)	An outline of any alternatives that were considered	An outline of alternatives that were considered is provided in Section 4.3.	Section 4.3

Offshore Minerals (Amendment) Ordinance 2011 Schedule 4		Notes	Location of information within the EIS
Sub-Para	Requirement		Chapter / Section[101]
(7b)	Indication of the main reason for the selected project design (taking into account the environmental effects)	**Indication for the main reasons that the proposed project design was selected is provided in:** • Section 4.3.2.1 for oil production. • Section 4.3.2.2 for oil export. • Please note the above describe the processes carried out by the previous operator and carried over by Navitas. • Further detail on the project optimisation by Navitas is provided in Section 4.4.	Section 4.3.2.1 Section 4.3.2.2 Section 4.4
8	Non-Technical Summary	The Non-Technical Summary is located in Chapter 1 and will also be available as a separate document.	Chapter 1
Paragraph 9: Difficulties encountered			
2	An indication of any difficulties (including technical difficulties and lack of know-how) encountered when compiling the required information	**The only difficulty encountered has related to data gaps in the environmental baseline and uncertainties with regard to the final project design:** • Wherever data gaps were encountered, efforts were made to address the gap. • Where this was not possible, a very precautionary approach was taken during the Impact / Risk Assessment and the worst-case was assumed with regard to the project-design. • The presence of data gaps is reflected in the overall confidence rating assigned to each assessment in Section X.X.10. Because a precautionary approach was taken throughout, and worst-case assumptions about emissions, residues and other outputs were used, it is possible that where the confidence is 'probable' or 'uncertain', the Impact / Risk may be lower than is estimated in this EIS. • As stated above, all monitoring requirements intended to validate the EIS, and fill existing data gaps, will be reported in the EMMP in Chapter 15.	Section 2.2.4 Section 7.2.4 Section X.X.10 in Chapters 10, 11 and 12 Chapter 15

APPENDIX 3 STATUTORY CONSULTATION REPRESENTATIONS AND RESPONSES

The FIG Offshore Minerals Ordinance (Section 3.1.7.3.1) requires that, following a compliance review against Schedule 4 of the Ordinance, every EIS undergoes a statutory 42-day consultation process. A record of the representations made during the consultation must be included within the final EIS, alongside responses from the Operator.

Two historical statutory consultations were carried out on various revisions of this EIS (under POEPL) and details on these are included within this Appendix for the sake of completeness.

Table A3-1 provides a summary of the representations made during the 2018 formal statutory and public consultation process on the EIS (Rev B03) which included inshore ship-to-ship transfer as the proposed oil export method (Chapter 4).

Table A3-2 provides a summary of the representations made during the 2020 formal statutory and public consultation process on the EIS (Rev B04) which was required following change of the oil export method from inshore transfer to direct offtake at the Sea Lion location (Chapter 4).

Note: for the sake of preserving the integrity of the comments, the chapter, section and page references in the tables below refer to those within the original documents to which they were responding (i.e., submissions B03 and B04 under POEPL). These may no longer match the chapter, section and page numbers in the current document.

Table A3-1: Summary of the representations made during the 2018 statutory consultation process on the POEPL EIS submission, Rev B03

Consultee	Representation	POEPL response	Amendments/further detail
OPRED Offshore Petroleum Regulator for Environment & Decommissioning			
OPRED 1	1. Areas of uncertainty Although there are number of uncertainties regarding the proposals at the EIS stage, OPRED do not believe they are material to the conclusions drawn for the offshore development proposals.	POEPL acknowledges and welcome the comments, which support the findings of the EIS. POEPL are happy that OPRED agree that uncertainties are not material and do not affect the validity of the assessment undertaken.	==
OPRED 2	2. Oil export options OPRED recognise that the base-case for oil export is the inshore transfer option, however the EIS also details the option of direct offload from the FPSO. Although OPRED would not object to either option, we would advise that the viability for the direct offload option should be explored further if this is considered in the future.	Direct offloading to the Purchaser's Conventional Trading Tanker (CTT) is the usual means to undertake export from an FPSO on a worldwide basis - this is the simplest and lowest cost option. The workability of this option however depends on the regularity of metocean conditions being below the operating limits associated with conventional trading tankers to reliably allow cargos to be offloaded. In harsh locations, higher operating metocean limits are necessary to achieve acceptable availability and this is achieved by using specialist Dynamically Positioned (DP) offshore loading tankers as is the case in the North Sea / UKCS. The remote nature of the Sea Lion location and the lack of operating experience in the prevailing met-ocean conditions mean that to guarantee a reliable offtake solution and enable sanction of the project, the base case for oil export needs to be on the basis of the use of DP specialist offshore loading tankers. Accurate knowledge of the met-ocean conditions is key to enabling direct offloading to a CTT and after over 2 years of met ocean data recording at Sea Lion, there is greater confidence that direct offloading to CTT may be viable. The FPSO offloading equipment will be specified to accommodate either of 2 types of offloading hose strings; approx. 120m for offloading to a bow loading tanker and approx. 320m floating hose for a conventional trading tanker. This capability will enable direct offload trials to be undertaken once operations have commenced. These sea trials will be conducted very early in	==

Consultee	Representation	POEPL response	Amendments/further detail
		field life once the FPSO is commissioned and if successful would result in POEPL seeking to amend the Base Case to direct offloading to a CTT. Further description of the process of developing Direct Offloading as an option is given in 'Additional Information' OPRED2.	
OPRED 3	3. Drilling operations OPRED note that POEPL propose to use Water-based Mud (WBM) for the drilling of the top-hole sections and Oil Based Muds (OBM) for the lower sections, which is standard UK practice. The batch sequencing of the sections will minimise the mud wastes as this method reduces the need for changes in the mud system. It is also noted that OBM contaminated cuttings will be processed through a thermo-mechanical cuttings cleaner and will be discharged with <1% dry weight on cuttings, which adheres to requirements of OSPAR Decision 2000/3. If the unit cannot be used, cuttings will be shipped to shore. The tophole sections of the proposed wells will be drilled using water-based mud and a suite of chemicals that are predominantly classed by OSPAR as PLONOR (Pose Little Or No Risk), and the overall impact on benthic fauna from the cumulative discharge of the drill cuttings is considered, as a precautionary conclusion, to be moderate.	POEPL acknowledges the comments which support the findings of the EIS.	==

Consultee	Representation	POEPL response	Amendments/further detail
	However, modelling indicates a comparatively small area of impact which will reduce significantly over a 5-year period and recolonisation is expected after 1-2 years (and the sensitivity of the receptor is considered to be low). OPRED would agree that the EIS assessment is precautionary.		
OPRED 4	4. Well testing As a base-case, no well tests are planned. However, there may be a necessity to undertake a maximum of 3 well tests at the MODU to confirm reservoir productivity. Well test volumes would exceed 5,000 tonnes of oil for each well and therefore would constitute an Extended Well Test under UK requirements. OPRED would consider this level to be excessive and would recommend that FIG should seek clarification of the quantity and proposed duration for each well test. We would further point out that, on the UKCS, it would be necessary to provide a detailed justification for any well test designed to flow in excess of 2,000 tonnes of oil or for any well test scheduled to continue for more than 96 hours. If any proposed well test exceeds those thresholds, it would therefore be appropriate to request a justification	Well test volumes have been re-evaluated by the POEPL subsurface team and it is now considered that flaring a total of 1,024 tonnes of hydrocarbons per well in a well test will satisfy the project requirements, with scope to perform such a test on two wells. A recalculation of the volumes is given in 'Well test'. The relevant EIS Section 5.4.9 would be re-worded as follows. 5.4.9 Initial well testing Well testing, to measure individual well flow rates, will be carried out throughout the life of the field as part of day to day operations (Section 5.8.5.7). A short flowback of two production wells to the MODU is being included in this assessment. In the base-case field development plan no flowbacks are planned, however provision is being requested, in case it is required nearer the time, to satisfy development criteria that may be requested by stakeholders. The flowbacks could be used to demonstrate repeatability of the original 14/10_5 well test, confirm well productivity and to prove the completion integrity. In the event that initial flow back to MODU on wells is deemed necessary then both gas and oil will be produced from the well to the temporary testing equipment on the MODU. There will be the need to flare both gas and oil due to the volumes that will be received for the test.	Text amended.

Consultee	Representation	POEPL response	Amendments/further detail
	and a more detailed emissions assessment to put the well test into some sort of environmental context, as it seems likely that the total emissions from the Islands are likely to be comparatively small. It would also have been beneficial if the EIS had provided some indication of any proposed best practice measures to minimise the impacts of the well tests.		
OPRED 5	5. Produced water OPRED notes that the monthly average of Oil in Water concentrations from produced water discharge will be below 30mg/l, which aligns with UK Regulations. It is also noted that the expected concentrations are 10-15mg/l, which is in line with current industry expectations.	POEPL acknowledges the comments which support the findings of the EIS.	==
OPRED 6	6. Operational chemicals As the chemicals will be compliant with the UK Offshore Chemical Notification Scheme (OCNS), OPRED can assume that the risk to the marine environment are unlikely to be significant. However, as the specific chemicals and dosages are yet to be confirmed, OPRED would advise that chemical risk assessments be undertaken prior to chemical usage.	POEPL acknowledges the comments which support the findings of the EIS. An assessment of risks from the discharge of the specific chemicals offshore would be undertaken prior to the relevant operations including drilling, installation and production. Chemicals would be selected from those on the UK Approved List that had undergone standard CEFAS testing for toxicity, biodegradation and persistence and chemicals with higher risks would be substituted with lower-risk chemicals with the required properties, as they became available.	==

Consultee	Representation	POEPL response	Amendments/further detail
OPRED 7	7. Decommissioning OPRED note that the development has been designed to enable full well abandonment and decommissioning, including subsea infrastructure unless a comparative assessment indicates a wholly or partially in-situ option is the best practicable option.	POEPL acknowledges the comments which support the findings of the EIS and note that while the design of the facilities has taken into account the ability to remove infrastructure at decommissioning, the detailed assessment of decommissioning impacts is outside the scope of the EIS in line with POEPL's discussions with FIG.	==
OPRED 8	8. Environmental baseline Overall, the EIS provided a comprehensive description of the environment and covered all of the salient issues. The level of environmental survey work undertaken provided an informed and contextual description of the development area which was very beneficial. It is also reassuring to note that through the Gap Analysis Programme further work will be undertaken to address data gaps at a regional level to aid the understanding of the Falkland Islands marine environment.	POEPL acknowledges the comments which support the findings of the EIS. Outputs from the Gap Analysis Programme will continue to be fed into the knowledge base that underpins the EIS and will feature in EMMP discussions as work proceeds.	==
OPRED 9	9. Noise assessment Whilst OPRED would agree with the conclusions of the assessment of underwater noise impacts (Section 10.4), OPRED found it difficult to correlate between the many sub-sections. Although there was mention of drilling noise as a non-pulsed source,	Underwater noise from the drilling rig was scoped out of the assessment as it is a relatively low level source of noise and noise levels are dominated by the piling and vessels that are included in the predictions and assessment. This is mentioned in the report referred to in the EIS (Genesis, 2015) and is corroborated by other documents e.g., measurements of a semi-submersible drilling rig (similar to that proposed for Sea Lion) by McCauley (1998) of 115 dB (rms) re 1µPa at 405m distance and the review published by BEIS "Genesis (2011) Review and Assessment of Underwater Sound Produced from Oil and Gas Sound Activities and Potential Reporting Requirements	==

Consultee	Representation	POEPL response	Amendments/further detail
	OPRED would question why a detailed assessment of vessel noise was undertaken but there wasn't a similar assessment for the drilling operations? In addition, although the EIS commits to undertaking operations with the use of the JNCC noise mitigation measures, we would advise that a further explanation of the mitigation measures should be provided and the precautionary principle followed given the species and number of cetaceans within the vicinity of the proposed development area. Within the EIS it is also stated that given the diving capability of marine mammals "…the JNCC advised soft-start and ADD devices may be a more effective mitigation than MMO's or PAM" (Section 10.4.6.1.3.1), and POEPL should therefore be asked to confirm the mitigation measures proposed for relevant noise producing operations.	under the Marine Strategy Framework Directive. Genesis Ref: J71656 Document No. J71656-Final Report –G2." The mitigation measures included in the JNCC Guideline referred to are summarised as follows: - A pre-start watches of up to 60 minutes to detect marine mammals surfacing within 500m (60 minutes is allowed for deeper diving species); - A delay of 20 minutes after the last sighting of a marine mammal within 500m; - A soft start to the piling that lasts 20 minutes; - A repeat of the pre-start watch and soft start when piling is stopped for a period greater than 10 minutes; - Reporting of activities and observations using the JNCC format. - Should piling be required to start in dark or foggy conditions such that visibility within the 500m zone is compromised, additional measures such as PAM will be deployed. The protocol, including whether ADDs are recommended in the light of the most recent data, will be agreed with FIG in consultation with its nature conservation advisors. This will be re-iterated in the update to the underwater noise predictions to be completed following submission of these responses.	
OPRED 10	10. Accidental pollution events OPRED is satisfied with the information provided within the EIS. Since the start of the EIS consultation period, POEPL has presented further information regarding the oil	POEPL acknowledges the comments which support the findings of the EIS.	==

Consultee	Representation	POEPL response	Amendments/further detail
	characteristics and the potential for a spill event to occur. The information provided concludes that the oil is heavy and has a significant wax content related to a high pour point and subsequently the reservoir requires additional pressure for flow to surface. A significant uncontrolled reservoir flow is therefore unlikely. Due to its characteristics, in the marine environment it would solidify almost immediately and no emulsification would occur. It has also been concluded that dispersants would be inefficient, but OPRED notes that POEPL are investigating other offshore clean-up solutions.		
Scottish Association for Marine Science (SAMS)			
SAMS1	Benthos 'B' 4.1.2 The B rating given above reflects the relative lack of information on benthic communities in the Sea Lion drilling area offshore. Less information is available for deep-water habitats in the Sea Lion drilling area, but this is to be expected given the remoteness of the location. This is reflected in the scoring of the Berkeley Sound area being an 'A', whilst the Sea Lion area is a 'B'.	POEPL acknowledges the comments which support the findings of the EIS. A significant survey effort was entered into prior to the most recent Exploration Wells campaign in order to set up a widespread baseline of the benthos that could be relied on for a long-term production project. 90 benthic stations were conducted over the licence block, far more than would normally be expected for an exploration well campaign. The benthic samples were processed by the Natural History Museum with many new taxa identified which have been given species codes and retained as voucher specimens for further work. On the basis of this survey, the GAP work developed online taxonomic tools for future surveys to ensure QA and QC controls. It has led to the identification of a large number of new species and is a step change in survey effort compared to previous campaigns.	Minor text changes.

Consultee	Representation	POEPL response	Amendments/further detail
SAMS2	Biosecurity 'A' Therefore, it is recommended that scrapes of biofouling present on artificial structures closely associated with the POEPL Sea Lion Development (e.g., Inshore Transfer Mooring Buoy) be included in the monitoring activities. Likewise a combination of panels deployed for short periods (6-12 weeks) and longer periods (annual inspection) will ensure that late succession species are included in the overall species list whilst ensuring sufficient frequency of monitoring.	POEPL acknowledges the comments which support the findings of the EIS. Monitoring of invasive species will continue *via* the EMMP building on the settlement plate work started by POEPL during the Exploration Wells campaign and suggestions for locations and methods can be discussed at the EMMP workshop in collaboration with FIFD and the wider management of Stanley Harbour, Port William and Berkeley Sound.	==
SAMS3	Fisheries, Fish and Plankton 'B' Although the report details the impacts of oil toxicity on fish/squid eggs, it is strongly recommended to look at a pathway to exposure for fish larvae and small squid as well. Fish eggs are likely to be more resistant to pollutants except for very small molecular chemicals. It is a dangerous assumption to take toxicity test results from eggs, and assume the results will be the same once the eggs have hatched. All the life stages need to be looked at, especially the early life stages.	POEPL acknowledges the comments which support the findings of the EIS.	==
SAMS4	Global Atmosphere 'A' No comments	POEPL acknowledges the comments which support the findings of the EIS.	==

Consultee	Representation	POEPL response	Amendments/further detail
SAMS5	Marine Flora 'A' Fig 73 (pg. 307) could be clearer, as it is difficult to tell between Macrocystis and open water due to the colours used to represent each.	POEPL acknowledges the comments. The map can be reproduced if required.	Open water and kelp are clearly different colours, however, there is very little Macrocystis in this image (small areas in the north east corner of the Cove). The image is in the document to illustrate the process of combining satellite images with on the ground surveys to produce the final habitat map. Magellan Cove was selected as an example and has little bearing on the overall assessment, in its own right. Therefore, we do not think there is any need to change the figure.
SAMS6	Marine Mammals 'D/C' Section 7.4.6. Marine mammals 4.6.7 There is reference to acoustic monitoring results summarized by Hipsey *et al.* (2013), but the specifics of data analysis (i.e., which call types, duty cycles, frequency range etc.), important information on ambient noise levels, and results for some species are either phrased very vaguely or missing from this section."	The JASCO report (Hipsey *et al.,* 2013) is available for review for further details. Some of the key points are given in 'Additional Information' SAMS6.	==
SAMS7	4.6.8 There are also some contradictions in this section. For example, while it is recognized that some species such as Antarctic minke whales were only described acoustically after Hipsey *et al.* (2013) was published, the report states that	The number of unidentified sounds was relatively small and an expert validation process was used by JASCO to ensure reasonable skill and care was applied. Other acoustic traits of Antarctic minke whale than their calls were	Text was amended to clarify the lack of sei and minke whales in the acoustic record.

Consultee	Representation	POEPL response	Amendments/further detail
	they were not detected. How could they have been detected if their calls were not known? It should rather be stated that the absence or presence of minke whales could not be established at the time of Hipsey *et al.*'s report was published. Similarly, with sei whales, they were not detected, but this could be due to a true absence or equally due to a lack of knowledge of call types. The language of the report could be more precise here.	used to identify their presence/absence so we believe the narrative is fair, but could be expanded to give more detail. For sei whales, JASCO (Hipsey *et al.,* (2013) reports: "The recordings did not contain any confirmed sei whale calls. Due to the potential overlap in calls from both species (e.g., Watkins 1981; Baumgartner *et al.,* 2008) and due to the absence of sei whale call description for the southern Atlantic, one cannot completely exclude that the Fin whale detection record included a few sei whale calls" Nevertheless, besides two sightings north of the Falkland Islands, all sei whale sightings during the JNCC surveys (White, *et al.,* 2002) occurred close to and south/west of the islands, which is consistent with the lack of sei whale detections in the study area. There is an inherent uncertainty with such studies whereby animals can be present but may not vocalise in range of the instruments, and the EIS attempts to draw together other data sources to reach a reasonable conclusion.	
SAMS8	Section 10.4.1.1 Relevant legislation 4.6.9 The EIS should mention noise regulation provisions under the EU Marine Strategy Framework Directive (2008/56/EC) as well as OSPAR (OSPAR 2014-08)	We acknowledge the noise regulation provisions noted by SAMS. EU Marine Strategy Framework Directive Task Group 11 has examined underwater noise and other forms of energy and its recommendations currently are not binding. POEPL hopes to involve the Chair of this Group (Mark Tasker) in forthcoming EMMP discussions for this project. OSPAR Agreement 2014/08 is not legislation but is relevant: Monitoring Guidance for Underwater Noise in European Seas.	Chapter 15 of the EIS (EMMP) includes a commitment to examine this issue further.
SAMS9	10.4.4.3.1 Invertebrates 4.6.10 Although little is known about the impact of noise on invertebrates, there have been several papers published recently on this research topic and these could be cited here, e.g., Morley *et al.* (2014).	This is acknowledged, although we do not believe addition of these references changes the outcome of the assessment.	==
SAMS10	10.4.4.3.2 Fish 4.6.11 Similarly to the review of noise impacts on invertebrates, newer	This is acknowledged, although we do not believe addition of these references changes the outcome of the assessment.	==

Consultee	Representation	POEPL response	Amendments/further detail
	assessments of noise impacts on fish are available and include Hawkins & Popper (2017), Simpson *et al.* (2016) or Nedelec *et al.* (2016). It should also be made clearer that for fish, particle motion might be more important than sound pressure level when examining noise impacts.		
SAMS11	10.4.4.3.3. Seabirds 4.6.12 The EIA misses some key recent literature on seabird hearing in this assessment, e.g., Maxwell *et al.* (2017) and Johansen *et al.* (2016).	This is acknowledged, although we do not believe addition of these references changes the outcome of the assessment.	==
SAMS12	10.4.4.3.4.1 Marine mammal hearing thresholds 4.6.13 It is not clear how the loudness of the sound an animal produces relates to its hearing range; while this may be true for the frequency range of species-specific vocalizations, the sound intensity seems of lesser importance in this context.	POEPL believe the EIS commentary is valid and provides context. POEPL agrees that there may not be a direct relationship between the intensity of an animal's vocalisation and hearing sensitivity. However, given the lack of extensive data regarding hearing sensitivity in many marine mammal species, the known range of vocalisations was included to give some context. These values are not used in the assessment, which relies on the best available thresholds for injury and disturbance.	==
SAMS13	10.4.4.3.4.4 Marine mammal injury thresholds 4.6.14 The injury thresholds cited here have recently been extensively reviewed and updated, which resulted in the new NOAA guidelines for 'Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing' (NMFS, 2016). These updated and adjusted guidelines and injury thresholds	Advice from JNCC on this project and in the UK more generally is that assessments already conducted may remain with the Southall *et al.* (2007) thresholds, while future assessments should adopt the NOAA (2016) thresholds, and predictions should be revisited before operations commence to confirm the relevance of mitigation zones. The underwater noise assessments for the Sea Lion EIS were completed prior to the NOAA Guidelines being published. The NOAA thresholds apply a slightly different method for species hearing weighting along with different thresholds such	The assessment has been repeated to include the updated thresholds in the NOAA guidelines (2016). There are some differences in the results of the assessment and proposed mitigation, and HF cetaceans in particular have a large mitigation zone. The chapters covering underwater noise have been updated to reflect this.

Consultee	Representation	POEPL response	Amendments/further detail
	include a lot of the more recent literature, and should replace the thresholds defined by Southall *et al.* (2007) and used in this report for noise impact modelling.	that we do not expect the outcome of the assessment to be significantly different. POEPL agrees to update the underwater noise assessments using the new thresholds by the end of May 2018 and will submit the revised assessment to FIG.	
SAMS14	10.4.4.4.3.3 SEL results and injury from vessel noise 4.6.15 It is not clear which functional cetacean hearing group was modelled in the scenario presented.	This will be updated with the predictions & thresholds relevant to NOAA Guidelines (see SAMS13).	Relevant text updated.
SAMS15	10.4.5 Industry-standard mitigation 4.6.16 The JNCC guidelines for minimising risk of injury to marine mammals from geophysical surveys have recently been reviewed and updated. There have been several critical reviews that have pointed out weaknesses of these guidelines, especially with regards to problems with using visual observers, using a 500 m radius from the centre of the seismic array for monitoring etc. (e.g., Nowacek *et al.,* 2013; Leaper *et al.,* 2015; Wright & Cosentino, 2015). The EIA would benefit from taking onboard some of these valid criticisms and suggest more proactive monitoring and mitigation approaches which in time will hopefully to an update of currently insufficient guidelines.	The EIS does not reference the JNCC guidelines for minimising risk of injury to marine mammals from geophysical surveys as seismic surveys are not in the scope of the EIS and would be subject to independent EIA process if they were proposed. The JNCC protocol for minimising the risk of injury to marine mammals from piling noise is referenced, and is under review by JNCC, meanwhile it is still the extant guidance from UK Government and is followed in the UK. POEPL has no doubt that JNCC will in due course make a balanced scientific assessment of recent evidence, including the papers noted that are critical of the seismic guidelines, and which may reflect on piling as another form of impulsive noise. As and when JNCC revise their protocol for piling noise we will be happy to discuss the implications within the EMMP group set up for the project. Following a reassessment of the impact of underwater noise, greater emphasis is now placed on PAM, along with MMOs to monitor for the presence of marine mammals within the scope of influence of project activities.	==

Consultee	Representation	POEPL response	Amendments/further detail
SAMS16	10.4.6.1 Impact assessment pile driving 4.6.17 For seabirds, the justification for 'low' impact based only on the application of JNCC guidelines and 'soft starts' is very weak, and difficult to follow (i.e., is there any research showing seabirds moving out of an area after application of soft start procedures?). The Reviewer considered the impacts to be at least 'moderate'. Similar to the situation with impacts on fish, it should be clearly stated that there is a knowledge gap which complicates this assessment.	The assessment recognises the potential for impact on seabirds, fish and invertebrates and attempts to assess the scale of the impact using the best available information. In the case of seabirds, there is not a recognised method of assessment and very little data regarding thresholds for impact. More is known about invertebrates and fish but it is recognised that this is an area that is poorly understood, especially in regard to the assessment of the impact of particle motion. Confidence in the assessment is 'Uncertain' due to these, and other, knowledge gaps.	==
SAMS17	4.6.18 For impacts of cetaceans (both disturbance and injury), a general conclusion of 'low' impact based on the application of current JNCC guidelines is not justified by scientific evidence. At the very least, risk reduction for impacted marine mammal species based on JNCC guidelines should be simulated by species and circumstance before these conclusions are drawn (see Leaper *et al.,* 2015).	JNCC provides guidance on measures to minimise the risk of injury to marine mammals. JNCC is led by the Joint Committee, which brings together members from the nature conservation bodies for England, Scotland, Wales and Northern Ireland and independent members appointed by the Secretary of State for the Environment, Food and Rural Affairs under an independent Chair. The assessment considers extant JNCC guidance in light of considerable scientific evidence and has used experienced and independent advisors in reaching conclusions on impact and risk. POEPL recognise that some authors are sceptical about the effectiveness of published precautions, but we cannot disregard the implications of extant government guidance that represents a substantial body of scientific opinion, by assuming that impacts were moderate after applying the recommended mitigations. The JNCC guidelines clearly state they have been developed to reduce to negligible levels the potential risk of injury or death to marine mammals in close proximity to piling operations.	==
SAMS18	4.6.19 With respect to the potential for disturbance, what scientific	The assumption that animals will move away from a source of noise is valid (see NOAA guidelines, 2016), although the response of an individual is likely	==

Consultee	Representation	POEPL response	Amendments/further detail
	evidence was used to validate the assumption that all animals will vacate the area after start of piling? To assign a 'slight' impact from disturbance from pile driving does not appear justified, nor is it supported by scientific evidence. Several scientific papers have pointed out the limitations of the current JNCC guidelines as mitigation measure (see above); for example, suggestions such as mandatory shutdowns should marine mammals be detected within the mitigation zone are still not required. Given these limitations of current guidelines, it is hard to follow the conclusion of the EIS of 'slight' impact.	to relate to a number of variables (such as; feeding activity, previous exposure). This is also inherent in the behavioural responses to noise described in the chapter (Table 145). The categories of disturbance are based on observations and are described in Southall *et al.* (2007). Should JNCC advise at a future point that shutdowns are a measure that should be adopted, then POEPL will consider this carefully and discuss it in the context of the EMMP.	
SAMS19	4.6.20 There is a gap in knowledge on impacts on fish, especially in the longer-term. Also several recent papers have suggested reduced communication space and masking (Clark *et al.,* 2009; Stanley *et al.,* 2017) as a possible severe impact for both marine mammals and fish. This should be acknowledged in the EIS.	Potential impacts on fish are listed in Section 10.4.4.3.2.2 and significant gaps in knowledge are acknowledged throughout the EIS. It is accepted that this section could be expanded to include impacts on communication space. but we do not believe this would alter the assessment, as each chapter contains a 'Confidence' section, which highlights these limitations. Greater emphasis is placed on marine mammals throughout as these are regarded to be the receptors of greatest conservation concern.	==
SAMS20	10.4.7. Project-specific mitigation measures 4.6.21 As pointed out above, due to the limitations of current JNCC guidelines, additional stronger	POEPL believes it is appropriate to follow the advice issued by the UK Government's scientific advisors (JNCC) and has committed to MMOs on vessels as a valid way to understand uncertainties in potential impacts, which will then be managed through the EMMP process. Controls on vessel speed offshore have not been identified as a necessary mitigation in the	Text updated accordingly.

Consultee	Representation	POEPL response	Amendments/further detail
	measures such as shutdowns upon animal detections, improvement of Marine Mammal Observer (MMO) and/or Passive Acoustic Monitoring (PAM) personnel knowledge and working requirements, biologically relevant safety zones etc. (see Wright & Cosentino, 2015) should be suggested in order to reduce risks to all receptors. With regard to vessel noise, a reduction of speed should still be recommended in order to reduce noise for ships with fixed pitch propellers and to reduce general collision risk with marine mammals	assessment and we have committed to monitoring underwater noise in operations which will provide a basis for ongoing review *via* the EMMP. Following reassessment, greater emphasis is now placed on PAM, which will improve detection of marine mammals. There is not a simple relationship between noise on vessel speed and the type of propulsion is more relevant (e.g., fixed pitch vs variable pitch propellers). Applying a speed limit may not influence the sound intensity, and the significance of the impact is not at a level that demands mitigation.	
SAMS21	10.4.8. Residual impacts 4.6.22 Based on their knowledge, the Reviewer considers the impact of pile driving in particular more severe than 'low' and therefore suggests that this section should be rewritten, taking into account the actual impacts and risks of both pile driving and prolonged vessel noise exposure for marine mammals.	POEPL believe that the rating assigned to the single event of a short term piling operation, as proposed, is reasonable. The JNCC guidelines clearly state they have been developed to reduce to negligible levels the potential risk of injury or death to marine mammals in close proximity to piling operations. Such operations and precautions are routine in many parts of the world with populations of similar animals. Cetaceans have strict protection under the Habitats Directive in European waters for example, and the extant guidelines and their application *via* mandatory consents supervised by independent MMOs are designed to allow developers to undertake operations with negligible risk of an offence.	==
SAMS22	10.5.4.4.1 Identification of source sound levels 4.6.23 It is stated that vessel noise will have greater impact on seals and baleen whales, due to most vessel acoustic energy being concentrated in the lower frequencies. This statement disregards several	POEPL recognise that high frequency components can give rise to impacts and a wide range of frequencies has been considered in the numerical analysis and described in the narrative on sensitivities. The main energy levels in vessel noise are in lower frequencies as described in the EIS which propagate farthest. The assessment incorporating the NOAA guidelines confirms that low-frequency cetaceans are most at risk of injury. The disturbance thresholds from Southall *et al.* (2007) for nonpulses such as vessel noise are derived from "relatively extensive behavioural observation"	==

Consultee	Representation	POEPL response	Amendments/further detail
	published studies showing the impact of higher frequency vessel noise (e.g., Hermannsen *et al.,* 2014; Aguilar Soto *et al.,* 2006; Jensen *et al.,* 2009; Dyndo *et al.,* 2015).	for LF cetaceans, observations of "A relatively large number of mid-frequency cetaceans" and "Numerous controlled studies" of HF cetaceans. These indicate that LF cetaceans tend to respond at lower received noise levels than MF or HF cetaceans. We note that Hermannsen *et al.* (2014) emphasises high-frequency noise from high speed jet ferries travelling at around 38 knots that are not representative of the Sea Lion Phase 1 Development vessels.	
SAMS23	10.5.4.4.3 Comparison of model results with injury thresholds 4.6.24 The updated NOAA guidelines (NMFS 2016) rather than Southall *et al.* (2007) should be used to assess potential for injury and behavioural response. With regards to fish and invertebrates, more recent scientific literature and suggested impacts should be considered.	The chapter has been updated in respect of the NOAA guidelines. POEPL acknowledges more recent references for fish and invertebrates and we believe that the assessment remains valid in light of these sources. We recognise that this is a developing area of science and the 5-yearly validity of the EIS along with the EMMP process is a responsible way of managing any future issues that might emerge.	==
SAMS24	10.11.8.1 Risk of collision during drilling, installation and production 4.6.25 Speed restrictions should be mandatory in order to reduce the impact to 'minor'; if restrictions are voluntary it is difficult to see how the overall impact significance can be confidently lowered.	The use of the word 'voluntary' is merely intended to denote that they are beyond legal requirements. The mitigation is a commitment that POEPL makes for the movement of tankers and is mandatory in terms of POEPL's requirements for the operation of those vessels. The risks of collision are greatest with the largest vessels due to their mass, restricted field of view and lower manoeuvrability. Therefore, restrictions on the speed of tankers inshore is a key mitigation measure that lowers the risk and it is a commitment along with all other mitigation measures. POEPL has committed to limit the speed of tankers in Berkeley Sound to 8 knots, which is lower than the USA National Marine Fisheries Service "Final Rule to reduce the likelihood of deaths and serious injuries to endangered North Atlantic right whales that result from collisions with ships" which is 10 knots. For other vessels that are of the same size range as existing vessels using Berkeley Sound, the advice of the Harbour Master will be observed. Further, MMO observations provided by POEPL-operated vessels will contribute to	==

Consultee	Representation	POEPL response	Amendments/further detail
		our knowledge of collision risks and will inform the best way to manage them.	
SAMS25	Regional Air Quality 'F' 4.7.3 There is not a huge amount of detail provided on regional air quality apart from combustion. It is suggested that further action on regional air quality is required. Accidental/unplanned emissions from each spill scenario should identify the regional atmosphere/humans as a receptor. Exposure modelling, following the procedures used in the water quality sections, should be followed for releases to atmosphere from hydrocarbon spills for each of the activities identified. The risk assessments should be revised to include the impacts to the regional atmosphere from e.g., oil spills of varying sizes, both offshore and inshore, diesel bunkering spills inshore and offshore, etc. These assessments should detail the loss to atmosphere of volatile hydrocarbons and other pollutants from each activity.	POEPL disagree that air quality impacts from oil spills are on an equivalent level of concern or scale as water quality impacts and this is not a routine expectation in the UK or other countries where POEPL operates worldwide. POEPL has, however, quantified the issue for the spill scenarios included in the EIS, undertaken screening modelling, compared this with established exposure thresholds and provided insight from a well-documented incident to support this position. This is given in 'Additional Information'. The loss of VOCs offshore and inshore is controlled to a minimum by having these design features: • No venting from the FPSO during normal production; • Use of Vapour Recovery Package during normal operations; • Back-up inert gas generator for use as cargo tank 'gas blanket' in the event that the Vapour Recovery Package malfunctions to prevent venting of hydrocarbon gas; • Use of a vapour balancing system to pass 'blanket gases' from the CTT cargo tanks to the OLST cargo tanks during transfer of oil from the OLST to the CTT. The effect of this is that emissions of VOCs offshore are negligible when compared to combustion emissions. VOCs and odour from tank vents during loading inshore was highlighted as a potential issue given the low thresholds for detection for some odourous compounds, and this is mitigated by using vapour transfer whenever possible, and the residual impacts are fully assessed using dispersion modelling with local topography and meteorological data in EIS Section 11.10.	==
SAMS26	The scenario modelling efforts present in the water quality sections should be utilised for regional air quality, e.g., Offshore spills: subsea well blow-out; loss of the FPSO crude oil inventory, plus two Offshore	See SAMS25	==

Consultee	Representation	POEPL response	Amendments/further detail
	Loading Shuttle Tanker (OLST) tanks; crude oil transfer spill; loss of the MODU diesel inventory and diesel bunkering spill. Inshore spill scenarios should also be modelled: e.g., between tanker collisions; 300 tonne crude oil spill; 3,000 tonne crude oil spill; 50,000 tonne spill; 300 tonne fuel spill. There seems to be a fundamental assumption that spills of volatile hydrocarbons will not have any impacts on regional air quality. This assumption is unsatisfactory.		
SAMS27	Seabed Sediment & Geology 'A' 4.8.7 No gaps were discernible with respect to geology, seabed sediment and bathymetry, although the description of the sub-surface geology could be improved (see Section 5).	POEPL acknowledges the comments which support the findings of the EIS.	==
SAMS28	Seabirds 'B' Presentation of seabird distribution data has some shortcomings. Table 63 (pg. 342) attempts to categorise seasonal distribution. However, much of this characterisation is based upon the White et. al. (2002) study, where survey effort was not uniform. Similarly, seabird vulnerability maps in Figures 95-98 (pgs. 380-383) are also of questionable value, given non-uniformity of source data. Section 7.4.5.3 Birdlife of Berkeley Sound	POEPL clearly highlight the limitations of the seabird distribution data in various places in the text, and are not suggesting that the maps and tables represent a quantification of seabird distribution and vulnerability, but rather a characterisation of these aspects to be used in the risk assessment. Non-uniformity of source data in seabird studies is an inherent problem in almost all offshore locations and the representation of data cartographically is valid and aids interpretation given that the limitations are highlighted. An independent report (Genesis, 2017) has examined the validity of the data. The offshore distribution data relies on a number of sources but White, *et al.,* 2002 is the most comprehensive. The coastal bird survey follows a set methodology as stated in the text, the maps are scaled and clearly not 'presence only'.	==

Consultee	Representation	POEPL response	Amendments/further detail
	(inshore) includes a series of Figures that details the seabird distribution in the coastal area of Berkeley Sound. It is unclear whether this data is presence only, or collected using appropriate transect mythologies, so the data can be accurately scaled.		
SAMS29	Social 'B' There are weaknesses in Chapter 11 in relation to the less technical aspects of some of the social impacts, especially in relation to fishing livelihoods and resource competition for accommodation where it is unclear whether these have been covered by the SIA or not. [comments relating to topics in the SIA are repeated]	Social impacts relevant to an EIS under the Minerals Ordinance are clearly described in FIG Guidance Paper 187-15 and POEPL has followed this guidance in examining air quality, noise and resource competition aspects in discussion with FIG on the scope of the EIS. Considerable work has been on assessing wider social impacts in the Falkland Islands society and economy including studies by Regeneris and Plexus e.g., referred to in 11.3.1. POEPL is currently reviewing and updating this work as required to ensure it aligns with the most recently available census data and project forecasts. Once completed, any additional reports will be made available.	==
SAMS30	However, within Chapter 11, there were frequent references to 'in comparison to other places in the world'. This seems to undermine evidence that POEPL is aware of the social context of the Falkland Islands, and the differences in social impact that might occur given that there are few places in the world with which it can be compared. As such, it would have been more beneficial had comparisons been drawn with locations that might have similar social contexts – e.g., the Shetland Islands. This would have been	The EIS uses 'world' comparison in relation to operation of harbours which must meet common worldwide standards under IMO rules and expectations and therefore has a legitimate basis for comparison. We disagree that there are frequent such references and where possible we have used objective standards such as for noise and air quality that apply to diverse communities across the UK and Europe. The Regeneris and Plexus studies contain more information on social impacts beyond the scope of the EIS (see also SAMS29).	==

Consultee	Representation	POEPL response	Amendments/further detail
	particularly nice to see for accommodation resource competition (Sub-Chapter 11.3, pg. 905).		
SAMS31	4.10.12 In Section 11.1.4.3 (pg. 864) there is a note which states; 'Importantly, it is out with the scope of this EIA to assess the safety implications with regard to the injury or loss of life on fishing vessels and this EIA explores only the potential environmental and social impacts with regard to the loss of tangible property.' Despite the legal ramifications for fishing vessels which do ignore the exclusion zone lying with the fishing vessels, the social impact of loss of life poses a real and tangible risk to POEPL's operations (not to mention local communities in the Falkland Islands). This note should perhaps refer to the SIA being conducted by POEPL and preferably cite the section which covers this assessment.	POEPL agrees that the wording is unfortunate and could better reflect the importance attached to the safety of other sea users, and the lengths to which POEPL goes in managing a wide range of risk controls to avoid incidents and minimise risk. The intent of the words is rather to point out that there are other POEPL processes, other legislation and other industry good practices that address these issues while the EIS is focussed on the environmental impacts and risks.	The note has been edited to indicate that safety is addressed elsewhere.
SAMS32	4.10.13 In Section 11.1.6.2.1 (pg. 871), loss of gear under normal fishing circumstances was considered in this EIS to cause 'moderate' impact. Loss of gear plus the legal ramifications of fishing in an exclusion zone due to POEPL's subsea infrastructure was also considered	POEPL believe the loss of fishing gear is addressed adequately. POEPL expect there to be little if any interaction between fishing gear and the development, and any such unintentional interaction would be dealt with *via* a fair and transparent claims process such as exists in the UK between the relevant industry bodies.	==

Consultee	Representation	POEPL response	Amendments/further detail
	'moderate'. Legal consequences will likely add to the impact on the livelihoods of fishers from the 'moderate' impact of fishing gear loss under normal circumstances. This is not clearly differentiated or considered within the text.		
SAMS33	4.10.14 Assumptions on fishing effort are based on data from five years ago (2013). No monitoring is suggested for fishing effort, but there is for shipping (both offshore). Impact was considered not to be higher than 'low' in both cases. It is unclear from the text why one will be monitored and the other not (Section 11.1.6.2, pg. 871).	Ongoing fisheries data is available but was not felt to be a variable to which the assessment is particularly sensitive, and interaction is quite limited in scale given the design standards in use for subsea infrastructure. Shipping data relates to the potential for a collision and a significant acute incident, which explains the difference in monitoring. POEPL will maintain contact with FIFD and review updated fishing effort days every five years as part of EIS update process.	==
SAMS34	4.10.15 The EIS states in Section 11.2.5.2 (pg. 896) that disruption to other vessels in Stanley Harbour will occur, but is likely to be 'minimal'. However, it is then stated that stakeholders (fishing and shipping) are 'resistant to a change on this scale'. It then assumes that occasional use of Falklands Interim Port And Storage System (FIPASS) will be acceptable to 'the majority of stakeholders'; fishing and shipping are large stakeholders, so this does not seem logical. The text then concludes that the sensitivity of the receptor is 'low'. In the following	POEPL agrees that the wording could be clearer, and it is intended to reflect that a long-term increase in POEPL-operated vessels using FIPASS could cause significant stakeholder concerns and consequently POEPL is planning that the TDF be the primary berthing and refuelling facility for all POEPL-operated vessels. This has resulted in POEPL proposing to build a diesel loading line into the TDF to avoid project vessels bunkering at FIPASS. This TDF upgrade would be subject to separate FIG approvals.	'Resistant to change on this scale' should read 'tolerant to change on this scale', the text has been amended. This should be regarded as a typo and this section reads more clearly with this wording. The wording used elsewhere in this section conforms with the definitions given in the methodology chapter.

Consultee	Representation	POEPL response	Amendments/further detail
	paragraph it then goes on to say that waiting for a berth to become available might be 'unacceptable to a minority of stakeholders' – concluding that the severity of the effect is 'minor'. Both of these conclusions are contradictory to the wording of the second sentence in the first paragraph of Section 11.2.6.1.1 (pg. 896), with the latter being based on assumption of stakeholder opinion rather than a direct reference to information garnered in the scoping consultations. This descriptive quantification of impact could be made clearer given that extensive stakeholder consultation was conducted in the scoping stage of the EIS.		
SAMS35	4.10.16 No consultation has been done with stakeholders on changes to the project since 2016 (pg. 218). This includes exclusion zone changes in Berkeley Sound. Therefore, the assumption in Section 11.2.6.1.2 (pg. 897) that 'inconvenience cause is expected to be relatively short-term and minor, although this may be unacceptable to some stakeholders' is not based on the real opinions of stakeholders. However, the document does state that these	The plans for Inshore Transfer have been widely advertised and discussed through the development of the EIS during 2016-2018. This includes the 500m permanent exclusion zone and the temporary exclusion zones during the Inshore Transfer operation itself. We believe the EIS statements are a reasonable, precautionary reflection of actual stakeholder views expressed to POEPL.	==

Consultee	Representation	POEPL response	Amendments/further detail
	changes will be highlighted during the public consultation phase.		
SAMS36	4.10.17 Section 11.11.1.1 might benefit from mentioning that the basis for conducting an L/SVIA is within EIA legislation.	POEPL accepts this point.	Text added to capture this.
SAMS37	Water Quality 'A' No comments	POEPL acknowledges the comments which support the findings of the EIS.	==
SAMS38	1.1.1 Section 1.2, pg.32. The location of the Sea Lion field is stated as '…the Sea Lion Field is an oil field which is trapped in underground sandstone rocks approximately 2.5km below sea level… '; this should read approximately 2.5 km below sea bed.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant has been text modified.
SAMS39	1.1.2 Section 7.3.4.1 pg. 256. 'The Patagonian continental shelf is one the largest and flattest continental shelves in the world' – a reference is needed to support this statement.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Citation added to the relevant text.
SAMS40	1.1.3 Section 7.3.6.1, pg. 271. The geological description of Northern Rift Basin ('….Cretaceous turbidite sandstone that form from a series of deep-water…. ') needs an age control. This extends to the rest of the section. Are the '…younger fans… ' tertiary in age? Also the referencing of (Casper, Casper South	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. POEPL has tried to make these sections readable for all audiences. For the more technical reader there are references for further reading.	==

Consultee	Representation	POEPL response	Amendments/further detail
	and Beverly) are presumably locations, but this needs clarifying. The authors would be better re-writing this section with formation, age depositional environment and reference to borehole occurrence.		
SAMS41	1.1.4 Section 7.3.6.2, pg. 271. The text states '…principally sandstone and mudstone with overlying Quaternary sediments.' Again age is missing so presumably these formations are Cretaceous or Early Tertiary in age?	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. – see comment above in response to SAMS40	==
SAMS42	1.1.5 Section 7.3.6.2, pg. 271. Reference is made to '…solifluction process'; soil creep is a terrestrial process, so the implication is the Quaternary deposits are terrestrial sub-aerial, and now submarine due to the post-glacial rise in sea level. It would be worth including a sentence clarifying this, supported by a reference, as this has implications for the nature of the seabed sediments in Berkeley Sound.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. – see comment above in response to SAMS40, SAMS41	==
SAMS43	1.1.6 Section 7.3.6.2, pg. 271. No age has been provided for the rock outcrops from the Fox Bay, Philomena, Port Stanley and Port Stephens formations.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. – see comment above.	==
SAMS44	1.1.7 Section 7.3.7.1.1, pg. 272. The statement on grain-size directly affecting the composition of benthic	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. If the more technical minded reader wants further	==

Consultee	Representation	POEPL response	Amendments/further detail
	communities needs a supporting reference. When discussion grain size, it might be worth including the Folk or Wentworth scale to illustrate the size classes."	information they can read Gardline, 1998a. POEPL has made a concerted effort to make this ES readable to a wide audience.	
SAMS45	1.1.8 Section 7.3.7.2.2.1, pg.281. Typographical error in last sentence before Figure 64; 'iflux ' should be influx	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant has been text modified.
SAMS46	1.1.9 Table 7 (Chapter 1, pg. 63) has the "Impact / Risk" Definition part after the matrix of activity, receptors and residual Impact / Risk. It is suggested that the definition is placed before the matrix part of the table, as it is otherwise potentially confusing - at first read the "Impact / Risk" seemed to imply some combination of Impact with Risk, which doesn't make sense in relation to the methodology.	POEPL accepts this point on drafting of the document and this could be added. Each species is nevertheless given a substantive description and we note that the readership would assume a conservative viewpoint as it stands, and the EIS conclusions would not be affected.	==
SAMS47	1.1.10 Section 6.2, pgs. 221-224. Scoping is described in reasonably detail e.g., Falkland Islands Fishing Company Association (FIFCA) and Fisheries Department (FIFD) seem to have been consulted during scoping. Table 49 summarises concerns (weighted by the number of raises) and links to the EIS Chapters where the issue is addressed. Do the Chapters fully address Stakeholder concerns, or do some residual gaps	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	==

Consultee	Representation	POEPL response	Amendments/further detail
	remain? It would definitely be useful to have a final Table which lists the concerns raised about inadequate knowledge against the information uncovered during the EIS, with an assessment of whether the knowledge gap still remains.		
SAMS48	1.1.11 Section 7.2.4.1, pg. 247. 'Impact of sea lion crude on fur' should read 'Sea Lion' not 'sea lion'.	POEPL accept this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant text amended.
SAMS49	1.1.12 The Falkland Islands GAP project seems an excellent initiative, and developer participation in the scheme is strongly encouraged. For example, under the EMMP the data that will be generated anyway, which would be of value to GAP, should be identified, as well as any additional useful things which could be monitored.	POEPL accept this point on drafting of the document. It does not materially alter the EIS conclusions.	==
SAMS50	1.1.13 Section 7.4.1.1, pg. 286. The last sentence implies zooplankton are also primary producers – they are not, sentence needs re-drafting.	We accept this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant text amended.
SAMS51	1.1.14 Section 7.4.1.2, pg. 286. Phytoplankton – this is quite a general section, is there no more up-to-date data for the phytoplankton around the Falkland Islands?	There are few scientifically robust sources of such data on planktonic blooms, although it would be possible to show the seasonal variation near the sea surface. The information displayed is representative of the phenomenon which is described and assessed in the text.	==
SAMS52	1.1.15 Section 7.4.1.3, pg. 288. Zooplankton – could do with a few sentences on seasonality to link	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Text amended to include a description of seasonality, Table 105 also amended to reflect

Consultee	Representation	POEPL response	Amendments/further detail
	better to Table 105 (pg. 475) and Table 106 (pg. 476) , and thus explain the patterns illustrated.		periods of peak zooplankton abundance.
SAMS53	1.1.16 Section 7.4.1.3.2.1, pg. 288. 'This is a very abundant species…' refers to two species of Munida; it should be corrected to 'These very abundant species …"	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant text amended.
SAMS54	1.1.17 Section 7.4.4, pg. 317. The use of the Northern Slope (NS) zone in relation to fish abundance was felt to be unhelpful – apparently the NS zone includes different areas, some of which are important for fish and fishing and some not. Throughout this section there is some confusion between the overall NS situation and the situation around the Sea Lion Development site. This arises at several points in the report where it is sometimes stated that the NS zone is very important for fish, which may be present at high abundance, but then it is argued that there are few fish around the proposed drill site.	POEPL accepts that some further clarity could result from distinguishing between large scale characteristics and small scale inferences at the development location, although it would not materially change the document. The NS is considered as an eco-region based on oceanography and environmental conditions. See Arkhipkin, A., Brickle, P., Laptikhovsky, V. V., Pompert, J. & Winter, A. (2012). Skate assemblage on the eastern Patagonian shelf and slope: structure, diversity and abundance. Journal of Fish Biology 80, 1704–1726.	Relevant text amended to make this clearer.
SAMS55	1.1.18 The text states that the NE part of the NS is rough with rocks and corals. Unfortunately, Figure 76 (pg. 318) does not indicate where this zone begins – it is therefore not very clear what the actual habitat around the Phase I site actually is. The Reviewer's feeling is that the NS zone	POEPL agrees there is heterogeneity in these regions and this could be clarified.	Relevant text amended.

Consultee	Representation	POEPL response	Amendments/further detail
	is actually too large to be useful for descriptive purposes, and seems to include a range of habitats and depths with varying importance for fisheries. It would be better to include a map that splits the NS into sub-zones by habitat or substrate (if that information is available), which will result in the text being less confusing.		
SAMS56	1.1.19 Section 7.4.4.2.3.2, pg. 323. The International Union for the Conservation of Nature (IUCN) status mentioned for yellownose skate and spurdog, but it would be helpful to indicate the IUCN criteria for all the species mentioned. Otherwise, it is left to the reader to infer that if an IUCN status is not mentioned then there is least cause for concern; stating the criteria would add some reassurance.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant text amended and citations added to the reference list.
SAMS57	1.1.20 Section 7.4.4.3, pg. 325. It is a little unclear as to what is meant by coastal and inshore fishing zones. The Reviewers understanding is that there is no commercial fishing permitted within 3 nm of the coast, but since “coastal” does not have a specific distance based definition, at least in common usage, it would be better to use a term like “3 mile	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. Note that these terms are understood locally.	Text amended through the document to make this clear.

Consultee	Representation	POEPL response	Amendments/further detail
	inshore no-commercial take zone" or similar appropriate wording."		
SAMS58	1.1.21 Section 7.4.4.3.1.1, pg325. Is the Bargelloni reference (Bargelloni *et al.,* 2000) really that relevant? It is probably very interesting, but the importance for an EIA is unclear.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. The reference adds context to local nearshore fish fauna in the Falkland Islands.	==
SAMS59	1.1.22 Section 7.4.4.3.1.2, pg. 326. The wording "as high as…" implies a large value, but the landing is only 15 t. It might be better just to say "up to 15 t"."	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant text amended.
SAMS60	1.1.23 Section 7.4.4.3.1.3, pg. 326. Beach seine catches are mentioned, but there was no commercial fishing within 3 nm of the coast, which implies that these were research fishing beach seine samples? If so, this should be stated clearly.	Small scale beach seine catches were recorded near the coast, but commercial fishing in this context refers to large scale fisheries with potentially damaging gear, whereas small scale fisheries are permitted.	==
SAMS61	1.1.24 Section 7.4.4.3.2.1, pg. 326. 3rd paragraph, end of third line - "out crops " should be "outcrops".	POEPL accept this point on drafting of the document. It does not materially alter the EIS conclusions.	Relevant text amended.
SAMS62	1.1.25 Section 7.4.4.3.2.1, pg. 326. The description of Loligo spawning behaviour in Argentine waters is a bit confusing – the Reviewer assumed that this was results of an experiment putting artificial substrates in the sea for the squid to lay eggs on? This part could do with re-wording for clarity.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions. The aim was to demonstrate that loligo lay on other structures other than kelp species so can use this to back up our belief that the spawning grounds are not just restricted to kelp and they are likely to be extending into deep waters on rock outcrops.	==

Consultee	Representation	POEPL response	Amendments/further detail
SAMS63	1.1.26 Section 7.5.1.2, pg. 422. There needs to be some more consistent in use of the terms 'coastal' and 'inshore' in relation to fishing activity – these seem to be used interchangeably, but seem to refer to different fishing zones in other parts of the text (see 4.3.19 also.).	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	The terms 'coastal' and 'inshore waters' have been defined in section 7.1. Also see SAMS57
SAMS64	1.1.27 Section 7.7.3.1.1, pg. 442. This section describes low fishing activity due to depth and rough ground, but this is in contrast with an earlier statement (7.4.4.2.1.1) that the ground in the NS is flat sandy mud, which is heavily trawled throughout the year. Table 57 (pg. 316) also says the Phase I site is uniform mud, gravel and sand with no erratics. In the Reviewers opinion, the lack of trawling activity around the Phase I site seems more related to depth, or some other factor, rather than bottom type.	Bottom type is stated by fishermen as a reason for not fishing the area, however, this may be due to experience in areas away from the Sea Lion Field. We agree the reported benthic analysis appears to disagree with this viewpoint. See SAMS55	==
SAMS65	1.1.28 Figure 126, pg. 445. Adding location of the Phase I drill site to the map would be advantageous.	We accept this point on drafting of the document. It does not materially alter the EIS conclusions.	==
SAMS66	1.1.29 Table 105, pg. 475. It is unclear how May-Jul has been identified as peak months for fish. Comparison with Table 58 (pg. 320) suggests that Jan-Mar is more likely the peak (based on adding up the	These sensitivity summaries distil a wide range of data to assist the public to come to high-level views, while the text and visualisations in the main body contain more detailed information for those seeking a more detailed viewpoint. The peak months reflect the seasonal presence of *Illex* in the region. By weight of catch, *Illex* is by far the largest fishery in Falklands waters.	The peak months reflect the seasonal presence of *Illex* in the region. However, the reviewer is correct to point out that the shaded areas did not reflect the seasonal abundance of fish and

Consultee	Representation	POEPL response	Amendments/further detail
	high abundance in NS boxes) – also that would make more sense in relation to the plankton production seasonality shown.		shellfish. The table has been amended.
SAMS67	1.1.30 Section 10.1.4.2.1, pg. 547. The section acknowledges impacts of artificial light on fish, but uses fisheries data to argue the area is not very important for fish. Some caution is recommended with this argument – although lack of commercial fishing is suggestive that the area is not that important for fish, there could be other reasons why trawling is not pursued here. Also the commercial data does not say anything about abundance of non-commercial species.	POEPL agrees this wording could be rephrased to be more specific to commercial fishing, although commercial fishing is often a proxy for other non-commercial species that are linked in the same food web.	Text amended to reflect the likely presence of unexploited species such as Myctophids.
SAMS68	1.1.31 Table 39, pg. 616. The Reviewer is unaware of any fish eggs that have gas filled spaces; these can develop in some fish larvae, and even at quite an early stage, as the swim bladder is inflated.	POEPL agrees. Current concern over the effects of sound upon eggs, and especially for larvae containing gas bubbles, is focused on barotrauma rather than hearing.	Chapters 10.4 and 10.5 (Underwater noise) have been revised to incorporate these points.
SAMS69	1.1.32 There is a Hawkins 2015 review on impacts of sound of fish which is more recent - Hawkins, A. D., A. E. Pembroke, *et al.,* (2015). "Information gaps in understanding the effects of noise on fishes and invertebrates." Reviews in Fish Biology and Fisheries 25(1): 39-64."	POEPL appreciate the contribution and it can be included in the updated assessment of underwater noise (see SAMS13).	Chapters 10.4 and 10.5 (Underwater noise) have been revised to incorporate these points.

Consultee	Representation	POEPL response	Amendments/further detail
SAMS70	1.1.33 Section 10.4.6.1.1, pgs. 633-634. If soft start procedures are always in operation, then it can be argued they will also mitigate noise impacts on fish as well. Exactly how the mitigation will be applied could do with clarifying.	Accepted - however the impact of the project's piling noise on fish is assessed as minor and mitigation is therefore not required.	==
SAMS71	1.1.34 Table 152, pg. 640. There is no evaluation of noise on fish behaviour; this does need including as a separate line from 'Injury to invertebrates and fish'.	Agreed, this could be added.	The influence of noise on fish is described i.e., the assessment already considers disturbance as well as injury, and Table 152 is updated to reflect this.
SAMS72	1.1.35 Section 10.6.4.2.5.1, pg. 670. Again, here it is repeated that the NS is important for feeding fish, which is slightly at odds with statements about the un-importance of the Phase I drill site for fish. It just leaves some confusion in the mind of the reader and a bit of doubt that you have really evaluated the site with regard to fish properly.	This again is a matter of the large scale of the NS versus the footprint of the development and heterogeneity within the area and could be more clearly worded. The development location is not a known fishing area, which is different to it hosting fish populations.	See earlier comments in reference to the NS SAMS55 and others
SAMS73	1.1.36 Section 10.6.4.2.6, pg. 672. The need to look at metal accumulation in toothfish and get more baseline data is raised, but it does not appear to be re-iterated in the EMMP. This may be an oversight, but if a deliberate decision needs to be explained.	The section describes how studies over many years have failed to show a meaningful connection between drilling discharges and metal accumulation in fish. The topic is not one that is of ongoing concern in the OSPAR area for example relating to far more intensive oil and gas operations. The question was raised by a fishing stakeholder during scoping exercises and we believe the discussion presented addresses the concern. Benthic sampling including metals has taken place offshore and will continue under the EMMP. Establishing a baseline for fish is not considered justified in terms of managing a non-significant impact but we are happy to discuss further with FIFD the ongoing monitoring of fish quality and how we can address any concerns they have.	==

Consultee	Representation	POEPL response	Amendments/further detail
SAMS74	1.1.37 Section 10.6.6.2, pg. 684. The first sentence needs redrafting as it is at odds with earlier description of phytoplankton being mainly in the upper part of the water column. "Distributed though the water column" implies they are fairly evenly spread with depth – which is not true. Also for zooplankton some mention of vertical migration should be made because it can transport material (including contaminants) from depth to near surface, and vice versa.	POEPL accept this point on drafting of the document. It does not materially alter the EIS conclusions.	==
SAMS75	1.1.38 Section 10.7.6.1.1 pg. 721. An assumption is made that (larger) organisms will move away from biocides, but this will only occur if they are able to detect them. What evidence is there for this? If none, then this must be stated as an assumption you are making.	The statement in the EIS is intended to reflect the point that motile organisms are less likely to stay within a discharge plume when that would involve some intelligence and expense of energy, and therefore is it relevant to assess plankton which could diffuse along with the plume.	==
SAMS76	1.1.39 Section 10.9.4.2.2, pg. 751. Some mention should be made of the role sea temperature plays in modifying the impacts of ocean acidification – it is quite an important factor in relation to colder waters.	We accept this point on drafting of the document. It does not materially alter the EIS conclusions.	==
SAMS77	1.1.40 Section 11.1.6.2.1, pg. 871. The 4th paragraph mentions trawling in area in the past – does this refer to the trawling described as "exploratory" in other sections?	POEPL's understanding is that trawling is no longer permitted in this area hence the form of the narrative used, which could be clarified.	Relevant text amended

Consultee	Representation	POEPL response	Amendments/further detail
	Using consistent terminology will help keep reader clear about what you are saying.		
SAMS78	1.1.41 Section 12.1.4.2.1, pg. 1082. Thermisto gaudich feeding patterns are referred, although it is unclear what relevance of this is to the impact being discussed?	POEPL agrees that the statement regarding this species providing an important ecological link between small zooplankton and top consumers is relevant, but its feeding habits are less so.	==
SAMS79	1.1.42 Section 12.1.4.2.1, pg. 1082. The Reviewer believes that eggs will not ingest oil droplets. Only very small molecules would cross the egg chorion – this is why larvae are often more vulnerable to pollutants compared with the eggs.	POEPL agrees that larvae are more vulnerable to pollutants compared with eggs, but the two studies cited in the EIS (Lee *et al.,* 2012; Almeda *et al.,* 2014c) support the statements in the EIS.	==
SAMS80	1.1.43 Section 12.1.4.2.1, pg.1082. The Ultra Violet Radiation (UVR) effect mentioned in the last sentence of this section needs some references to support the statement.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Two references were added to the relevant text and in the reference list
SAMS81	1.1.44 Section 12.1.4.2.3.1, pg. 1083. The sentence "Cephalopods are sensitive to environmental conditions, which can affect their abundance and distribution widely" reads a bit oddly and could do with re-drafting. In addition, the statement on squid as a potential bioindicator species lacks any supporting references – have they been used in this manner elsewhere? Given that squid are quite mobile (at least in the Reviewer's opinion), does	POEPL agrees that the first sentence of the paragraph on Cephalopods could be re-drafted to clarify this point. Squid are identified as having potential to act as bioindicator species in environmental monitoring studies due to their rapid growth rates, short life-spans, such that the accumulation of pollutants in their tissues reflect the bioavailability in the immediate environment over a relatively short period of time. However, it would be useful to note the reviewer's comment that their mobile nature may limit their potential as bioindicators.	Text amended

Consultee	Representation	POEPL response	Amendments/further detail
	this not present some problem with using them as biomonitors?		
SAMS82	1.1.45 Section 12.1.4.2.3.2, pg. 1083. Toxicology tests on zebra fish eggs are mentioned several times but as indicated in other comment, tests are required on larvae as well. Fish eggs are likely to be more resistant to pollutants except for very small molecular chemicals. It is a dangerous assumption to take the results from eggs, and assume the results will be the same once the eggs have hatched. Similarly, for proposed work on squid – all the life stages need to be looked at, especially the early life stages. The section on impacts on adult and larval fish is rather muddled – it jumps about and needs re-ordering in logical sequence: eggs, larvae, juveniles, adults. Overall, this section was not as well written as other parts of the report the Reviewer looked at."	POEPL acknowledges that larvae could well be more sensitive than eggs. Zebrafish are standard laboratory animals and give us standardised results in the same way as the algae, plankton and crustacean tests that have been undertaken on the crude oil. This enables us to assess the toxicity versus other substances, and it is normal practice in chemical risk assessment to use results from standard organisms to extrapolate onto the wider ecosystem by taking into account assessment factors that reflect the uncertainties in doing so. The results are consistent in that the crude oil is very low toxicity with a very low fraction of soluble components that are most harmful to aquatic organisms. The physical characteristics strongly point to the oil remaining floating and away from the seabed and main water column where most eggs would be found, and the toxicity results on fish eggs showed little or no effect using water accommodated fractions derived from very high concentrations of oil. We have committed to looking at toxicity towards squid eggs (15.6.1.2). As it stands, there is a very large body of literature on the impacts of oil on the life stages of animals and the level of oil testing undertaken for Sea Lion crude goes far beyond other projects worldwide. We believe that the uncertainties are far larger in terms of where fish eggs occur and it would be more fruitful to identify spawning and juvenile sites as part of fisheries management. We note that identification of squid spawning is an EMMP topic and a GAP Phase II topic.	==
SAMS83	1.1.46 Section 12.1.4.2.4.2, pg. 1085. The last sentence in the 1st paragraph on this page is unclear ("Even if tainting…"). Although the Reviewer understood the intended point (the public perception that fish are tainted may damage markets even if there is no detectable	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Public added to perception. The reviewer has understood the intended message and therefore it seems unnecessary to change the text.

Consultee	Representation	POEPL response	Amendments/further detail
	taint), but the sentence could do with redrafting to make it easier to understand.		
SAMS84	1.1.47 Section 12.2.4.2.3, pg. 1192. The relevance of the Braer data to the present EIS is not clear – in other parts of the report it is stated that the characteristics of oils at Sea Lion are different to other incidents, so is that the case with Braer? If they are different then how useful is the information given for evaluating Sea Lion risks? However, if it is comparable then you need to make that clear. The writing of this section is also a bit muddled and could do with re- organising.	The intention of this section is to illustrate some of the oil spill impacts on benthic communities that have been documented following spills. It is acknowledged up front that the type of oil will influence the nature and extent of impacts, and the purpose is to illustrate the potential impacts of oil contamination of benthic communities. Further, it is noted that even within the Sea Lion context, there are different types of oils that could be accidentally released (crude, MGO or IGO). Nevertheless, the basic components of all oils are very similar, as they contain aliphatics, aromatics, polycyclic aromatics and naphthalenes, and comparison between case studies is valid provided the differences are understood, as here, and impacts are interpreted at the relevant level.	==
SAMS85	1.1.48 In some later tables, (e.g., Tables 309-312 in Section 2.2.6.1), the mix of 'Sensitivity of Receptor and Severity of Effect (Impact)' together with text in one column, followed by Impact and Likelihood subsequent columns was a bit confusing to follow. It may have been better to have all these evaluations in column format, thus enabling the reader to quickly scan across to see how the final (unmitigated) risks were arrived at (as per Table 295 in Section 12.1.12).	The format in Table 309 etc. was chosen in order to condense the results of a lengthy chapter into a single table and the overall layout needs to be consistent within the document. It may be possible to split 'sensitivity' and 'severity' into separate columns but we are unsure if this would make it clearer.	==
SAMS86	1.1.49 Section 15.6.1.2, pg. 1349. It is strongly recommended to look at	As noted above, substantial specific test data has been generated for Sea Lion crude oil and is supported by worldwide experience in oil spills in order	==

Consultee	Representation	POEPL response	Amendments/further detail
	a pathway to exposure for fish larvae and small squid, as well as fish/squid eggs for reasons stated above.	to draw conclusions in the EIS, and we note the low solubility of the oil, the low aromatic content and the low ecotoxicity in the standard species tests. Nevertheless, we agree that ingestion pathways are unusual for this oil type given its highly waxy and persistent nature and this would be a relevant topic for EMMP discussion. Indicator species to be discussed at EMMP.	
SAMS87	1.1.50 There were some typographical/formatting errors in the sections on regional air quality; for example, on pg. 760 there is a cross reference to a section (0) that doesn't exist.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Formatting errors have been corrected
SAMS88	There are some typographical/formatting errors in the document; it is very difficult to produce a document this large (1432 pp) without errors of this nature. For example, on pg. 138 there is a duplicated sentence, and on pg. 499 a repeated paragraph.	POEPL accepts this point on drafting of the document. It does not materially alter the EIS conclusions.	Formatting errors have been corrected
Joint Nature Conservation Committee (JNCC)			
JNCC1	Noise modelling has been undertaken to estimate the risks posed to marine mammals from piling operations. Injury ranges have been estimated based on thresholds proposed by Southall *et al.,* 2007. We highlight that new injury thresholds were published in 2016 by the National Oceanic and Atmospheric Administration1. This technical guidance includes revised frequencies for hearing groups and updated injury	POEPL accepts this comment. POEPL's understanding of current UK practice is that assessments already conducted may remain with the Southall *et al.* (2007) thresholds, while future assessment should adopt the NMFS (2016) thresholds (NOAA Guidelines), and predictions should be revisited before operations commence to confirm the relevance of mitigation zones. The underwater noise assessments for the Sea Lion EIS were completed prior to the NOAA Guidelines being published. The NMFS thresholds apply a slightly different method for species hearing weighting according to the type of animal, along with different thresholds for injury and disturbance, such that	The underwater noise assessment has been updated in line with the NOAA guidance resulting in increased mitigation zones for HF cetaceans in particular and additional mitigation measures.

Consultee	Representation	POEPL response	Amendments/further detail
	thresholds which takes account of additional research undertaken since the publication of Southall *et al.,* 2007. It is likely we will be formally endorsing these new thresholds/ hearing functions in 2018 and therefore we are recommending operators use them in future assessments. We believe the NOAA thresholds may result in larger predicted injury ranges for some marine mammals. Subsequently, we recommend the Phase 1 noise modelling (which includes piling) for marine mammals is repeated prior to work commencing to ensure predicted injury ranges are within mitigation zones.	we do not expect the outcome of the assessment to be significantly different. POEPL agrees to update the underwater noise assessments using the new thresholds by the end of May 2018 and will submit the revised assessment to FIG.	
JNCC2	Planning and operational controls (including mitigation) can typically cover the risk of auditory injury that could result from noise exposure, however the risk of disturbance, particularly the cumulative effects of several disturbances, is considerably more difficult to assess and mitigate. Disturbance could have implications to survival and fitness, particularly if animals are disturbed from a preferred foraging area. In terms of estimating disturbance ranges, the level of sound received by an animal does not seem to be the sole	POEPL understand the point being made about the importance of empirical evidence in combination with, numerical thresholds. OSPAR recognises "Some studies (e.g., DeRuiter *et al.,* 2013; Pirotta *et al.,* 2015b) have shown that sound level can be a poor predictor of behavioural responses, and that other parameters (such as distance to source) may be more relevant. " The use of threshold and their specific values, are nevertheless are based on a consensus of a group of recognised world experts in light of extensive scientific information. Cumulative disturbances are a concern for example in areas of the North Sea where multiple wind farms are being constructed with large diameter, continuous piling over several years, whereas the piling proposed for Sea Lion Phase 1 is a single short term event, and vessel noise is a widespread phenomenon across various industries present in Falkland Islands waters. If further projects are proposed, cumulative impacts will certainly be more relevant.	==

Consultee	Representation	POEPL response	Amendments/further detail
	important aspect in determining a response and its significance. Therefore, it is preferable to examine empirical evidence from comparable circumstances when considering displacement, rather than numerical criteria for the onset of disturbance as used in noise modelling. It can also be helpful to consider the occurrence of past activities within an area to help determine a baseline and provide context. SNCB guidance on disturbance to European Protected Species (JNCC, 2010 2) considers that disturbance in terms of UK regulations is unlikely to result from single, short-term operations, e.g., a seismic vessel operating in an area for 4-6 weeks, or the driving of a dozen small diameter piles. Such activities would most likely result in temporary sporadic disturbance, which on its own would not be likely to impair the ability of an animal to survive, reproduce, etc, nor result in significant effects on the local abundance or distribution.		
JNCC3	We commend POEPL on their intention to follow JNCC mitigation guidelines for use during piling operations. Given that the activities will be carried out in deep waters and the possibility of deep diving species	POEPL accepts this comment and is commited to including the 60-minute pre-watch into the EMMP outputs where it will be carried forward into operations. MMO reports will be submitted to FIG after the end of the relevant operations.	==

Consultee	Representation	POEPL response	Amendments/further detail
	being present, we advise the use of a 60-minute pre-watch period. Adequate implementation of the guidelines, customised to mitigate for predicted injury ranges should reduce the risks of injury to marine mammals to negligible levels. We recommend use of the guidelines are included as a condition of any consent issued and Marine Mammal Observer (MMO) reports are provided at the end of the project to licensing authority.		
JNCC4	We also commend POEPL on their intention to introduce measures to reduce collision risk to marine mammals in inshore waters. We agree with the approaches proposed and again recommend using these measures are included as a condition of any consent issued.	POEPL accepts this comment. It is expected that this will be included in the EMMP outcomes and suggest that a specific condition may not be necessary if compliance with an EMMP is an overarching condition.	==
JNCC5	We note that specific details as to how either of these mitigation plans will be implemented is sparse within the EIA, as is information on proposed monitoring plans. FIG may wish to consider including a requirement in any consent issued, for a marine mammal mitigation and monitoring plan to be produced and approved (by the regulator and/or a nature conservation advisor) prior to works commencing. JNCC are	POEPL will develop an Environmental Management and Monitoring Plan which will draw on the outline in the EIS and output of the EMMP workshop that includes all such activities. Currently, the EIS structures the draft EMMP into types of work and marine mammals are included in 15.5.1.3, 15.5.2.5 and 15.6.3.2. POEPL would be very happy to discuss optimal structuring of the EMMP to make it most useful to stakeholders and we suggest this can be done immediately post EIS-approval when an EMMP workshop will be held.	==

Consultee	Representation	POEPL response	Amendments/further detail
	available to offer advice on such a plan should you require it.		
JNCC6	The document states that "However, none of the species found are rare or protected under any Falkland Islands legislation". Although this statement may be true, this does not mean that areas of conservation interest may not still be present in the area (noting that work is ongoing in the Falkland's to identify marine areas that support important aggregations of seabirds and other fauna) and therefore a cautious approach should be taken.	POEPL understand the important areas of conservation interest and agree that a better wording would be e.g., "Although none of the species found is rare or protected under any Falkland Islands legislation. Work is ongoing to identify important marine areas, and as such work develops, new designations can be incorporated in the ongoing management of the project *via* the EMMP and the 5-yearly review of the EIS."	Text amended.
JNCC7	The bullet points at the top of the page state that only six species were recorded in mud habitat and five species were recorded in fine sand habitat. JNCC considers that these numbers seem extremely low for the area and would ask POEPL to clarify if these are correct, and if so, explain why this might be the case? Were the surveys undertaken only considering epifauna, rather than the addition of infauna?	The SMSG surveys are visual census surveys based on Reef Life Survey (RLS) methods which were used to estimate densities of invertebrates and macroalgae, as described in Edgar and Stuart-Smith (2014). Therefore, only a record of epifauna / flora on the surface of hard and soft sediments is presented. The surveys are repeatable and comparable in this context.	==
JNCC8	JNCC would request that in future applications POEPL use the Latin genus and species name, where possible, to aid identification and prevent confusion between common names of species.	Accepted, and we will also consider adding an Appendix to list all the species referred to.	Throughout the document, we have endeavoured to provide scientific names where a species is first mentioned in the text.

Consultee	Representation	POEPL response	Amendments/further detail
JNCC9	JNCC would request that if any species of conservation importance e.g., sponges or deepwater corals are found during future surveys, that they be recoded and avoided by operations where practically possible.	POEPL agrees and we expect to have a common understanding of what such species are in advance of any guidelines specific to the Falkland Islands. At the FPSO anchor locations, Drilling Rig anchor locations, well locations and flow line routes we will undertake site surveys (normally sidescan sonar) prior to mobilising to the site that will identify features with unusual reflectivity which will then be targeted with ROV survey. We will take all reasonable measures to avoid direct impacts to any significant features in full consultation with FIG and its advisors including JNCC.	==
JNCC10	JNCC would request that 'Large dropped objects' be included in further assessments, as we believe that until further surveys are conducted, the impacts of large dropped objects on the seabed cannot be fully considered and understood.	Agreed, and the table already states that further assessment is required with regard to large dropped objects.	==
JNCC11	JNCC would request that 'Discharges of hot water from cooling systems' be included in further assessments, as we believe that the impacts of water, heated above ambient temperature, on surrounding benthos, particularly in waters influenced by cold water currents, is still not fully understood and would need further consideration.	Agreed, and the table already states that further assessment is required with regard to thermal discharges.	==
JNCC12	JNCC would request that 'Presence of oil spill infrastructure' be included in further assessments, as we believe that until further surveys are conducted and the final decision is made on what infrastructure will be installed, the extent and severity of	Agreed, and the table already states that further assessment is required with regard to the presence of oil spill infrastructure.	==

Consultee	Representation	POEPL response	Amendments/further detail
	the impact cannot be fully understood.		
JNCC13	JNCC would ask POEPL to justify the inclusion of 'Fuel combustion for power generation by all vessels during all activities' in further assessment regarding its impact on benthos. We would expect this operation would have limited or no impact on the areas benthos.	Agreed, but we note that this is not currently included anyway.	==
JNCC14	Page 303, Table 55, Line 2; States 'Sand cobbles and pebbles medium depth'. JNCC request that POEPL clarify what is meant by 'medium depth'?	The descriptor 'medium depth' is linked to the terminology of the SMSG depth strata classification and in the sense in which they are used in the EIS, 'medium depth' can be ignored.	==
JNCC15	JNCC would request that POEPL increase the image size of habitat video/ stills taken in the areas of interest to help facilitate better understanding of the habitats present, more accurate classification and aid in providing appropriate conservation advice.	These were graphics prepared by Benthic Solutions and we are unable to modify them. We suggest it would be preferable to provide the original reports to JNCC which we are happy to do.	==
JNCC16	JNCC would request that POEPL provide evidence as to why the mussel beds recorded at stations 11 and 17 do not constitute 'mussel bed' habitat?	Our interpretation is that the mussel beds at stations 11 and 17 are biogenic reefs but the small aggregations of mussels found at four other stations are not considered to be biogenic reefs. We note OSPAR policy in respect of Lophelia pertusa and Sabellaria spinulosa habitats, that aggregations less than 25m2 are considered of lesser conservation importance.	==
JNCC17	JNCC would like to highlight to POEPL that the OSPAR List of threatened habitats includes intertidal Mytilus	PMO would say there are some questions over their taxonomy here. They are abundant in the Falkland Islands and are unlikely to represent a threatened habitat here.	==

Consultee	Representation	POEPL response	Amendments/further detail
	edulis beds, as well as those stated in this section.		
JNCC18	JNCC commends POEPLs commitment to carry out further seabed surveys to inform baseline information, validate the EIA and assess any future remediation needs, as well the creation of a POEPL monitoring strategy during the Environmental Monitoring and Management Plan (EMMP) workshop. JNCC are available to offer advice on such a plan should you require it.	POEPL appreciates the kind offer and look forward to receiving JNCC's advice.	==
JNCC19	There is evidence that suggests marine benthos can in some instances react to impacts from noise, JNCC request that POEPL show their reasoning behind the scoping out of noise impacts on marine benthos.	POEPL are aware of a small number of studies, e.g., linking mussel feeding behaviour to the noise from passing ships, although we are not aware it is a matter of significant concern. We will reference this topic when updating the underwater noise assessment to explain why it is not in scope for more detailed evaluation.	The underwater chapter has been revised and this was scoped out.
JNCC20	There is also evidence that suggests marine benthos can be impacted by artificial light, particularly in areas of shallow water. JNCC request that POEPL show their reasoning behind the scoping out of light impacts on marine benthos.	POEPL are aware of a small number of papers on this topic and will continue to review the literature on this topic. Given the depth of water offshore (>400m), it is not anticipated that any light would reach the benthos, and underwater lights are restricted to the use of ROVs which have a very localised spatial extent and used intermittently, hence the issue has been scoped out. Inshore, ships' lighting is already a feature to which the benthos is routinely exposed (see existing satellite images of light in Figures 145 and 146) and the additional impact of POEPL's activities is not considered of concern.	==
JNCC21	The last bullet point mentions several small Southern Giant Petrel colonies in the north of East Falkland, at Black	POEPL confirms that the giant petrel colonies referred to are included within the 'Very sensitive areas' on Figure 147 in 10.2.4.2.3. Our exploration well campaign provider Bristows were contacted regarding their observance of	==

Consultee	Representation	POEPL response	Amendments/further detail
	Point and Rincon Grande. Giant Petrels are extremely susceptible to disturbance from their nest sites and abandon nests and eggs at a very low disturbance threshold (R. Phillips, pers comm.). It is not clear from Figure 147 exactly where the Southern Giant Petrel colonies are located and if they coincide with the flight path from Stanley Airport to the Sea Lion Field. These colonies, being located some distance from Stanley or MPN airports are not likely to have become habituated to disturbance from helicopter noise. It may be advisable to ascertain whether the FILFH avoidance maps indicate avoidance of these colony areas or stipulate a minimum flight height of 3,000 ft.	the low flying handbook, and in response they confirmed the strict induction process that takes place, they provided POEPL with the maps used as the basis for avoiding areas sensitive for wildlife and they also noted that all flight paths are recorded and retained on their GIS system for later enquiry. In examining the flights for POEPL during the Exploration Wells campaign, the vast majority of logs are at 4000' or 5000', well above a height that should cause an issue for wildlife. A small number of points were identified that were lower than 3000' over the areas with higher potential for bird strikes, but these appeared to be either low-level SAR flights or that the altitude had to be reduced for operational reasons and hence remained in line with the local policy. An example of the GIS system screen is shown in 'Additional Information'. POEPL believe the issue has been accurately assessed but we are very happy to facilitate a conversation with Bristows for a more exhaustive look at the historic data.	
JNCC22	Whilst JNCC would accept the 'Risk Significance' to be 'Low', given the presence and projected application of the Falkland Islands Low Flying Handbook (FILFH 2015), however we would query the assessment of 'Disturbance to Wildlife' in terms of 'Sensitivity' as 'Low'? This is given the previous extensive section in 10.2.4.1.1 detailing the nature of potential impacts to seabirds, such as penguins, where a mass mortality incident of 7,000 King Penguins was	The scale of the incident described in Rounsevell and Binns 1991 and Cooper *et al.,* 1994 was linked to the local geomorphology and is not typical of interactions between helicopters and penguins observed elsewhere (e.g., Hughes *et al.,* 2008). The assessment states that; by following the FILFH guidelines the exposure of sensitive receptors will be greatly reduced hence the sensitivity of the receptor is also reduced and is considered to be Low (as defined in the methodology).	==

Consultee	Representation	POEPL response	Amendments/further detail
	attributable to over-flight by a helicopter (Rounsevell and Binns, 1991; Cooper *et al.,* 1994).		
JNCC23	JNCC note the High numbers of Sooty Shearwater in Berkeley Sound during the periods Summer, Autumn and Spring. Also noting that this species is given a Near Threatened (NT) status under IUCN.	Response included in JNCC25	==
JNCC24	Also noting, from Table 123, the High numbers of Prion species present in North Falkland Basin area during winter, when the potential for collision is significantly increased due to more frequent occurrence of poor weather and longer nights. Although we recognise these species are given an IUCN status of Least Concern (LC).	Response included in JNCC25	==
JNCC25	We would query the assessment of impact being 'Possible' for likelihood of multiple bird strike for both areas. We note the evidence presented in Table 124 on bird strikes reported during the 2015 POEPL Exploration Drilling Campaign, which does indicate a level of both bird strikes and mortality associated with it. However, these incidents are all single individual strikes, and would seem to give no supporting indication as to the likelihood (or otherwise) of multiple bird strike incidents. From a precautionary standpoint, it would	The assessment draws on experience of bird strikes around the Falklands. There are many vessels operating both offshore and within Berkeley Sound; although small scale bird strikes frequently occur, large events such as that described in Black 2005 have not been reported. However, the likelihood of 'Possible' acknowledges that these events are likely to occur within the life of the Sea Lion Field, which is appropriate in our opinion. During the recent Exploration Wells campaign, no bird strikes were reported offshore and the two strikes reported were at the TDF where the facilities were not obviously any different to many other commercial facilities on the shoreside.	==

Consultee	Representation	POEPL response	Amendments/further detail
	seem reasonable to allow for the possibility of there being at least one incident of multiple bird-strike events in a year. Adequate monitoring and reporting of such incidences as development continues will provide important contextual information as to the likelihood or not of such multiple bird-strike events happening on an annual (or less frequent) basis. Moreover, on the provision of monitoring data regarding such incidences, a more informed examination of the likelihood of impact on particular species can be made. We would note that if multiple bird-strikes were observed to occur, then the likelihood or not of potential impact at a population level, is entirely dependent on the scale of the incident (and therefore further data is required before anything conclusive can be stated). A previous incident of vessel lighting induced mortality of Southern Ocean seabirds, reported 900 birds impacted on a single night (Black 2005).		
JNCC26	JNCC welcome the plans to continue the Bird Strike Monitoring Programme (BSMP), initiated during the 2015 exploration drilling campaign. However, we would note	Response below - JNCC27.	==

Consultee	Representation	POEPL response	Amendments/further detail
	that information on how any bird strikes that do occur will be preserved and identifications made could not be found within the EIA It will be important to ensure that those monitoring the bird strikes have sufficient identification skills to accurately record the species subject to bird strikes, particularly if birds are being released alive (as opposed to dead birds being kept and later identified).		
JNCC27	JNCC would be interested in further details of the BSMP, in particular, how, when and who will record any incidents of bird collisions and to what body these will be reported to? JNCC also requests clarification on the following points: • What would the response be to a large incident of bird strike i.e., with many individuals injured or killed in one day or one short period? • Would all these individual birds be thoroughly recorded and species identified? • Is there a critical threshold number of birds where operations that may be attracting birds, such as flaring if this took place, or adverse weather conditions, would be halted?	The EMMP includes setting up an initial seabird and MMO observer network using available vessels and establishing a monitoring and reporting format. A Bird Strike Management Plan is a commitment within the EMMP and we will consult on the best methods to deliver this plan. We would begin by ensuring the design and operation of the facilities followed OSPAR Agreement 2015-08 to minimise risks. Bird strike will be established as a specific operational metric. POEPL anticipate that trained crew members on the installations would be responsible for recording and reporting bird strikes, and the means of ensuring robust results will be discussed *via* the EMMP and informed by the initial seabird and MMO network. References such as Ronconi *et al.* (2015) provide a basis for such monitoring. HSE incidents such as this are routinely reported on installations *via* the daily operational meeting ('morning call') in the first instance and included in the Daily Report for the installation so that it is flagged to managers who are then responsible for investigation and closeout. This would include reporting to the regulator in a reasonable timescale (e.g., within 48 hours in the UK for non-compliances, or forthwith if there are ongoing issues requiring regulator input). The 'bird monitor' would be familiar with the issue of bird attraction *via* his induction (as would the Offshore Installation Manager) and they would immediately investigate sources of light, food, weather patterns, bright	==

Consultee	Representation	POEPL response	Amendments/further detail
		objects, odours etc. that might be contributing. The OIM is experienced in making real time decisions about emerging HSE issues in terms of when and how to modify operations and will also contact his managers quickly to discuss the appropriate reaction or precautions. This would involve minimising the perceived attractant immediately as far as safely possible. The bird monitor would count all birds and photograph separate species or significantly different individuals for later identification. As well as collecting any dead birds for identification, any live birds found on deck would be cared for until it was deemed safe to release them.	
JNCC28	JNCC note that 'Large scale bird collisions offshore' merits a 'severity' rating of 'Moderate' and yet 'Large scale bird collisions inshore' merits a 'severity' rating of 'Minor'. What is the reason for this disparity in 'severity' assessment?	As stated in the ES; inshore, POEPL's activity adds to an already existing significant source of light pollution. However, offshore the Development represents a new, 'permanent' light source particularly in the winter. As such there is a greater deviation from the current baseline offshore.	==
JNCC29	As highlighted through the EIA, there are a number of threatened, vulnerable and endangered seabird species that frequent the waters around the Sea Lion field. A major accidental oil spill event has the potential to impact upon and kill significant numbers of protected seabirds through oiling and ingestion of oil.	Response is below (JNCC30).	==
JNCC30	Figures 95-98 on pages 380 to 383 clearly demonstrate the vulnerability of various seabird species throughout the year in the form of the Seabird Vulnerability Maps. However, POEPL should be made aware that these maps are based on data collected	POEPL is happy that JNCC recognise the clear demonstration of seabird vulnerability provided by Figures 95-98. It is acknowledged in the EIS that the age of the Seabirds-at-Sea dataset, and inherent limitations of the survey method, mean that there are some questions regarding how representative the data are of present day populations. See Section 7.4.5.2.1.1. The EIS does acknowledge data gaps and the methodology explicitly incorporates uncertainty. An independent	

Consultee	Representation	POEPL response	Amendments/further detail
	some 20 years ago as part of the SAST surveys.	review of the data (Genesis, 2017) concluded that while there were gaps, the seabird data was adequate for EIS purposes and equivalent to frontier areas of the UK with oil and gas activity. Given these uncertainties, a precautionary approach has been applied to the assessment of risks to seabirds e.g., in the oil spill assessments they have been considered as high sensitivity and impacts assessed as moderate, serious or major depending on the size of the spill. It is also acknowledged that a combination of satellite tracking and at-sea observations is likely to provide the best overview of seabird distribution within the waters of the Falkland Islands. The Sea Lion Development EIA process has been guided by local experts *via* the Hydrocarbons Forum and Gap Analysis Projects. POEPL and partners have funded the Gap Analysis Project to identify and help complement project-based knowledge and reduce uncertainty, and available results have been included in the EIS, including using seabird tracking data to complement the 3-year regional seabird programme published in 2002. Satellite tracking of higher predators has been ongoing and the results have recently been amalgamated with data collected throughout the Falkland Islands. The findings of this work will be applied to further colonies in a predictive form to better determine the distribution patterns of seabirds and seals. However, the results of this latest work were not available at the time of writing.	
JNCC31	Page 1107, Figure 237; shows that the whole of the north coast of East Falkland would have exposure to oil, covering King Penguin colony at Volunteer Point, all other penguin species and Southern Giant Petrel colonies on north coast of East Falkland. Therefore, it would be helpful in this section to have a summary of oil spill response procedures for the treatment of oiled	Figure 237 indicates that there is a low probability of oil reaching the shore following a worst-case blowout i.e., there is zero shoreline oil in many outcomes. The worst case volumes are still a very small fraction of the release and would barely be detectable spread over such large areas. By the time oil reaches the coast (minimum of 80 days), it will have weathered and pose little risk of oiling seabirds. Oil Spill Strategies have been prepared as agreed with FIG. These include Offshore and Inshore Oil Spill Strategies, both of which have been submitted to FIG. These detail all the main items of equipment and response methods including wildlife response and shoreline response to minimise further exposure to which POEPL is committed as part of their response and which provide a clear basis for the Oil Spill Contingency	==

Consultee	Representation	POEPL response	Amendments/further detail
	seabirds, in the event of a serious accidental oil spill incident in the Sea Lion Field, as well as measures to be taken to minimise the further exposure of birds to further oiling after the event.	Plans which will require FIG approval before operations can commence. POEPL's use of detailed hydrodynamic and spill models allow the response to be targeted and proportionate.	
JNCC32	We are concerned with the limited options and constraints presented for oil spill response and believe that a large scale pollution incident from this development could potentially have significant impacts on the environment around the Falklands.	POEPL acknowledges this statement of concern. It is inevitable that large-scale pollution incidents can have significant impact wherever they occur in the world, and this is reflected in the assessment. The nature of Sea Lion Crude is, however, less hazardous than most crudes from which experience is drawn from historic incidents - it is less adhesive to birds' feathers, less adhesive to shorelines, less likely to contaminate sediments and less soluble with a lower PAH content making it less toxic in the marine environment. It is far more important to prevent releases than to attempt to control oil once it is in the environment, particularly offshore where weather conditions limit recovery and given that dispersant is not effective. Spills are prevented offshore by a variety of means including the application of Safety and Environmentally Critical Elements processes which were strengthened after the Deepwater Horizon incident *via* a European Directive and a significant revision of the Safety Case Regulations. These require systems that control Major Environmental Incidents to be managed in a formal way that brings those risks to a tolerable (low) level, by ensuring that systems are in place to manage critical equipment (design, reliability and maintenance), operational procedures and personnel competence, brought together as the management of Safety and Environmentally Critical Elements.	==
JNCC33	National Oil Spill Contingency Plan The documents states that "Oil spill response equipment is stored at the Falklands Interim Port And Storage System (FIPASS) to counter this risk. Offshore, the NOSCP relies on the use of dispersants providing that the oil	POEPL has designed its oil spill management around its own risks and does not rely on the NOSCP alone. In addition to pre-positioned equipment, POEPL has access to the international inventory of equipment managed by Oil Spill Response Limited and Wild Well Control. The EIS does include an evaluation of a sustained response to a 77- day blowout and predicts that 12% of oil on average could be recovered offshore, and recovery would be much higher inshore where weather conditions are more favourable.	==

Consultee	Representation	POEPL response	Amendments/further detail
	and environmental conditions are suitable". However, we note that dispersant chemicals are not considered as a viable option as they are not effective on Sealion Crude. With this in mind JNCC would like POEPL to clarify whether this pre-positioned equipment would be able to sustain a significant spill clean-up? Can POEPL provide information on how much sealion oil the pre-located equipment could contain/ recover and how long this response could continue for if being used in an ongoing response? We note from experiences of spill incidents and exercises around the UK that oil containment equipment can only recover a relatively small proportion of a slick.	Dispersant use is not effective on Sea Lion crude and is not planned and in any case, dispersant merely moves oil from the sea surface into the water column and reduces mechanical recovery. The reliance on dispersant use in UK-based responses is a key reason why recovery during historic incidents is often poor. Recovery proportions in Norwegian-based responses where mechanical recovery is favoured are much higher. The response plans for Sea Lion crude focus on mechanical recovery. A response will continue for as long as necessary, to a point where the incident commander decides that the actions are no longer productive. POEPL routinely makes financial provision for a response that includes the 77-day period to arrest a blowout and a 172-day period to drill a relief well if necessary. This also includes the cleanup that is simultaneous to this and the cleanup that takes place after the source has been controlled. The Inshore Oil Spill Strategy for example shows activities continuing for 6 months in a Tier 3 scenario.	
JNCC34	Inshore Oil Transfer JNCC accept that the occurrence of an accidental release of oil is unlikely. However, due to the oils properties: thick, persistent, unlikely to break up naturally for some time, as well as not being amenable to dispersants, there are still major concerns to the marine environment; particularly for seabirds and marine mammals, especially within Berkeley Sound. We would suggest keeping higher risk activities offshore where possible and	POEPL is committed to continuing to pursue the feasibility of Direct Offtake of oil from the FPSO to conventional trading tankers. If this is proved viable, it would remove the need for the routine Inshore Transfer of crude oil - please see the document referenced under 'Additional Information - JNCC34' for a fuller description of this issue. Currently, Inshore Transfer is a necessary part of the development and the use of Berkeley Sound is primarily to take advantage of the calmer weather conditions and straightforward navigation that reduce safety and environmental risks. Our quantitative risk assessment study, undertaken by DNV-GL and referenced in the EIS, has also enabled us to identify the operational measures necessary to minimise risk such as the use of a	==

Consultee	Representation	POEPL response	Amendments/further detail
	ask if POEPL has considered the precautionary setting up of booms around the bunkering operations an option, or using technology such as smart buoys (this technology is used in Arctic shipping lane routes to detect traces of hydrocarbons in the water and helps to facilitate a rapid response).	mooring buoy, a qualified Pilot, a vessel traffic management system, and many other measures. For bunkering of fuel in Berkeley Sound we will have in place a dedicated oil spill response vessel and a Multi-Role Support Vessel with oil spill response capability and bunkering would be undertaken to international standards including the OGUK Guidelines for Offshore Marine Operations. The risks are not of the same scale as transferring a crude oil cargo, and are managed appropriately without defensive booming. We note that Berkeley Sound has been chosen as a sheltered water used historically as an anchorage and fuel/cargo transfer location where the risk of accidents due to weather is minimised. POEPL has employed several international experts in oil spill response to design the response strategies and equipment. The risks from our operations are present at discrete locations at the FPSO and mooring buoy in Berkeley Sound where there is a high level of surveillance from the vessels present, and the use of smart buoys has not been recommended. POEPL appreciate this advice and will confirm with our advisors the suitability of such devices and continue to monitor the recommended equipment and emerging technologies as we draft the Oil Spill Contingency Plans for approval prior to operations. We can see the potential of such devices as an early warning system for unidentified sources of oil and it may be a solution to help detect existing sources of oil pollution that give rise to underlying levels of bird contamination in the Falkland Islands."	
JNCC35	Dedicated Oil Spill Response Vessels JNCC would like to query why a dedicated oil spill response vessel is not required during certain parts of the proposed operations? Given worst-case scenario well blow-out rates and the assumption that in ideal weather conditions, 30 tonnes of oil an hour could be recovered, POEPL predict that 12% of spilled oil could	The dedicated oil spill response vessel is required in Berkeley Sound prior to any tankers entering, and will remain there in a state of readiness until all tankers have left. Our hydrodynamic simulations of Berkeley Sound and our monitoring using a wave buoy have confirmed that conditions are such that mechanical recovery of oil in Berkeley Sound is feasible in the vast majority of conditions. Offshore, however, sea states are much higher, and this makes the catamaran design of the dedicated oil spill response vessels inefficient and their overall size and seaworthiness is also unsuited to serious duties offshore. Although containment technology in the form of booms is	==

Consultee	Representation	POEPL response	Amendments/further detail
	be recovered. We query why more containment equipment is not on standby and what is the likelihood that mechanical recovery would be possible given the Falklands offshore weather conditions? It would also be good to understand further why in-situ burning was not considered as a viable option (i.e., the document mentions the need for FIG consent (Page 121), but this isn't explained in any detail and seems to have been scoped out of response planning without much explanation).	available in a range of duties and designs, sea states in excess of 2.5m are very problematic in achieving significant rates of oil recovery worldwide. POEPL has included oil spill recovery equipment on the Multi-Role Support Vessel that will be in attendance offshore, which can be deployed in 30 minutes in the event of a spill, equipped with two skimmers capable of 60 tonnes per hour recovery combined. 12% is the expected recovery fraction for a prolonged subsea blowout where dispersed oil is emerging onto large areas of sea surface, and where it is conservatively assumed that ongoing safety issues prevent recovery for the first 24 hours; for smaller spills, recovery can be more targeted and more rapid and a much higher recovery would be expected in favourable conditions. The prevention of oil release is of primary importance and this is controlled by the management of Safety and Environmentally Critical Elements. Burning of the Sea Lion crude has not been recommended due to a combination of the difficulty of booming oil for long enough offshore in the expected sea states and, more importantly, due to its low content of volatile (flammable) components making it very unlikely to burn. This possibility was discounted at an early stage by our oil specialists.	
JNCC36	Oil Spill Contingency Plan The document states that "POEPL has developed an Offshore Oil Spill Strategy for the Sea Lion Development which identifies the essential components of spill response for this operation. It will shape an Oil Spill Contingency Plan (OSCP) that will later (closer to the start of operations) be submitted as a separate document which contains specific operational information, such	The Oil Spill Strategies (for Offshore, Inshore and Stanley Harbour) were available during the consultation period. We attach the relevant section on wildlife response ('Additional Information') which has been developed by a group of international experts including Aiuka in Brazil who are recognised for their skills in responding to oil spills affecting South Atlantic wildlife. The remote location and the current scarcity of manpower and equipment were significant considerations when the strategies were developed and is reflected, for example, in using POEPL staff and offshore crews as part of the staffing of oil spill response, whereby the FPSO would be down manned in the event of a serious incident. POEPL also has access to personnel and equipment resources *via* Oil Spill Resource Limited for Tier 3 response.	==

Consultee	Representation	POEPL response	Amendments/further detail
	as detailed action lists and contact details for personnel". It would be helpful to have an understanding of what these plans are in relation to seabird and marine mammal oiling, given the remote location of the Falkland Islands and the difficulty of obtaining man-power and equipment in the short time frame necessary to affect a rapid response to a large-scale wildlife oiling event. Are there facilities on land/ plans in place for this?		
JNCC37	Considering the oil type/ predicted behaviour and general offshore weather conditions likely to be encountered in this area, we ask that the OSCP details how tracking and monitoring of an oil spill/ actual slick would be carried out, as the response options presented seem to be fairly limited for this development. We assume this document will also detail waste management plans. JNCC would welcome being consulted on the production of the OSCP and available to offer advice on such a plan should you require it.	Surveillance is a key part of spill response and is documented in the Oil Spill Strategies. The surveillance would be carried out by trained personnel and specialised equipment. - Helicopter surveillance: Crew change helicopters will be utilised to conduct aerial surveillance. For this to be effective several POEPL personnel will be trained in aerial surveillance. Infrared cameras will be available for helicopter deployment. - Tracking Buoy: A tracking buoy will be stored in the warehouse onshore and transported to the source of the spill when required. The tracking buoy will accurately track a surface oil spill dependent on prevailing Metocean conditions. - Satellite: POEPL has access to satellite surveillance through membership with OSRL. - Aerostat surveillance system: Helium aerostat (balloon) fitted with optical and infrared sensors to monitor oil trajectory and location day and night. Data link back to command centre. This system was chosen over a remote controlled aerial droid surveillance due to the reduced training requirement and robustness of the system being able to withstand 50 knot winds. Computer modelling of the spill would be started immediately using the forecast mode of the detailed hydrodynamic model generated by POEPL	==

Consultee	Representation	POEPL response	Amendments/further detail
		along with the oil weathering properties determined by laboratory analysis in order to focus surveillance and response actions. The modelling would be updated with visual observations as the response progressed. We have specifically tested detection of the oil masses at the laboratories in CEDRE and confirmed that IR detection is viable. We would be very happy to discuss the preparation of the OSCP with JNCC post-sanction of the project.	
JNCC38	Sufficiency of survey evidence JNCC is of the opinion that insufficient survey evidence was presented in the application to allow the best provision of accurate and meaningful advice. While we recognise that it is unlikely that survey-based data can be expanded upon for this application, we provide the following to help FIG and POEPL understand what we consider necessary in an application. • Survey data should at least include the area of proposed operations, unless justification is provided as to why wider area surveys are sufficiently representative of conditions at the site of proposed operations. • Survey data should provide adequate evidence that habitats and species of nature conservation concern are or are not present. • It is good practice to include a diagram indicating the surveyed area in the context of the proposed	Sufficiency of survey evidence JNCC is of the opinion that insufficient survey evidence was presented in the application to allow the best provision of accurate and meaningful advice. While we recognise that it is unlikely that survey-based data can be expanded upon for this application, we provide the following to help FIG and POEPL understand what we consider necessary in an application. • Survey data should at least include the area of proposed operations, unless justification is provided as to why wider area surveys are sufficiently representative of conditions at the site of proposed operations. • Survey data should provide adequate evidence that habitats and species of nature conservation concern are or are not present. • It is good practice to include a diagram indicating the surveyed area in the context of the proposed activity and to identify any sample points or the location of photographic evidence. Data provided should also include high resolution acoustic data, video and /or still images. However, JNCC accept that POEPL has stated that they are committed to carrying out further seabed habitat surveys as part of their Sealion field development Environmental Monitoring and Management Plan (EMMP). JNCC are available to offer further advice on such a plan.	==

	activity and to identify any sample points or the location of photographic evidence. Data provided should also include high resolution acoustic data, video and /or still images. However, JNCC accept that POEPL has stated that they are committed to carrying out further seabed habitat surveys as part of their Sealion field development Environmental Monitoring and Management Plan (EMMP). JNCC are available to offer further advice on such a plan.		
JNCC39	Stabilisation material The application involves the potential introduction of hard substrate into a mainly sedimentary environment. Although the changes are not necessarily considered as having a significant impact in this instance, we still encourage POEPL to continue working to minimise the amount of hard substrate material used. We note that the long-term effect of the introduction of substratum into naturally sandy or muddy sea beds is not fully understood at present and should be carefully considered by the regulators. We would welcome further detailed commentary on stabilisation/ protection operations to allow	Currently POEPL do not envisage rock placement being necessary for stablisation or impact protection in the project and so there is no further information to provide on this topic. In terms of pipeline protection, there is little fishing activity predicted in or near the immediate footprint of the facilities, a standby vessel will be present at all times and surface laid lines will be designed for anticipated loading from bottom gear as a precaution. Should a potential deployment of rock arise at a later stage in the project we are certainly aware of JNCC's concerns and appreciate the expectations around it being brought to our attention.	==

Consultee	Representation	POEPL response	Amendments/further detail
	further understanding of their actual potential nature conservation impact. This would include: • Location of dump sites • Size / grade of rock to be used • Tonnage / volume to be used • Contingency tonnage / volume to be used • Method of delivery to the seabed • Footprint of rock • Assessment of the impact • Expected fate of deposit after end of production, i.e., will it be left *in situ* or recovered?		
JNCC40	Cumulative Impacts JNCC wish to clarify why fisheries within the Sealion field have not been considered as a factor that could influence cumulative impacts of the project?	Fishing intensity in the vicinity of the field is so low that cumulative impacts are not considered a realistic prospect.	==
JNCC41	Gap Analysis Programme JNCC ask whether POEPL expect to have additional survey data and outputs prior to the commencement of the drilling campaign?"	Prior to commencement of the drilling campaign we expect additional outputs to be available from the GAP Phase II work scope including work on identifying squid spawning grounds and also outputs from the out workings of the Phase I work scope e.g., applying tracking data findings in a predictive mode for other colonies. POEPL will commission SAERI to undertake a further inshore seabird survey and begin work on integrating this into seabird colony population estimates. POEPL will set up a seabird carcass survey protocol by selecting representative beaches for survey, with the aim of being able to distinguish	==

Consultee	Representation	POEPL response	Amendments/further detail
		the added impacts of oil spills on background oiling and mortality at reference locations. Site survey data will be collected at the development location prior to the arrival of the drilling rig and FPSO to identify any local seabed features of interest.	
JNCC42	Invasive species The introduction of non-native species to the marine environment around the Falkland Islands could pose a major threat to native biological diversity. JNCC commends POEPL's commitment to follow IMO guidelines on exchanging ballast water and managing biofouling organisms. JNCC also commends POEPLs commitment to taking samples of ballast water for analysis from all vessels coming inshore and arriving 'in-ballast', as well as the review of sampling results being drawn into the EMMP.	POEPL appreciate the feedback on managing invasive species.	==
JNCC43	JNCC ask POEPL to confirm if the weather conditions considered 'acceptable' i.e., Mean 10-min wind speed <30knots, Significant wave height <3m and Visibility >1,000m are realistic for the Sealion Field and whether these 'acceptable' criteria are based on modelled date or historical data from the area?	POEPL confirm that these criteria are satisfied for the majority of the time at the Sea Lion Field location and the full spread of metocean conditions are included in our design, operational and safety assessments which are in turn reflected in the project economics. A large amount of metocean analysis and measurement has been done to accurately determine the sea and weather conditions which feed into a wide variety of decisions. A detailed hydronamic model has been constructed by BMT in collaboration with Oceanwise using the TUFLOW model drawing on international datasets for metocean forcing and where results have been calibrated using measured data from oil and gas operations in the basin over many years. Data gathered by POEPL during exploration wells in the vicinity of Sea Lion has also been used as input to the model. The model has produced 20 years of	==

Consultee	Representation	POEPL response	Amendments/further detail
		outputs at a high resolution that are used e.g., for predicting the proportion of weather conditions suitable for offloading using different vessels. POEPL can supply the metocean modelling report to JNCC.	
JNCC44	Decommissioning JNCC consider it best practice for decommissioning plans to be outlined in as much detail as practically possible, as early as possible in the planning stages of a fields development. Although the EIA states that all subsea infrastructure and pipelines will be removed during the decommissioning of the Sealion field, we would request that POEPL take a pragmatic approach and consider if this 'clear seabed' approach is achievable in its entirety, and if not, to begin discussions about what might be left *in situ* as a worst-case scenario. Should FIG require a full decommissioning plan for this project then JNCC are available to offer advice on such a plan.	The EIS notes that the concept allows for the simplest means of decommissioning. It is true that some items such as small flow lines can be problematic to recover in later field life if they have become weakened or buried etc. and there may be a discussion around such items closer to decommissioning to be included in a Decommissioning Programme for approval. Nevertheless, we expect to follow UK practice in that the main infrastructure items will all be removed and a debris survey will be undertaken resulting in a clearance certificate.	==
JNCC45	Survey Reports JNCC request that POEPL provide any environmental survey reports relating to the Sea lion field development to us when available.	See response JNCC38; large amounts of data are stored in the South Atlantic Database hosted by SAERI http://www.south-atlantic-research.org/metadata-catalogue. The original datasets can be requested from the data owners, and a significant amount of data is publicly available *via* the webGIS service associated with this site.	==
JNCC46	Corrections The paragraph references Chapter 0, 11.0 and 0, however it appears this reference doesn't exist in the document. We request that	Noted, this should be Chapters 10, 11 and 12.	All links to Chapters, Sections, Figures and Tables have been checked in the final document.

Consultee	Representation	POEPL response	Amendments/further detail
	this reference is amended for the next version of this publication.		
Falkland Islands Government, Department of Mineral Resources (DMR)			
DMR1	General: Page: : Proposed date for EMMP workshop?	POEPL would aim to undertake an EMMP workshop Post-EIS approval and in the run-up to a Sanction decision at a mutually convenient time.	==
DMR2	General: Page: : The FIG Wildlife Response Plan 2015 is not mentioned and should be as a separate document to the NOSCP	Agreed, this could be made clearer.	FIG's Wildlife Response Plan 2018 was published after submission and will be included in the Oil Spill Response Plans that are required for the project closer to operations.
DMR3	General: Page: : The Offshore Oil Spill Strategy and Stanley Harbour Spill Strategy should both be in the list of references and accessible by members of the public on request.	These can be added to the references and we have advertised their availability at all public consultations sessions.	References updated
DMR4	2.1.2: Page: 72: Has the FDP document FK-SL-PMO-PM-PLN-0004 (referenced in this para) been requested by the public as part of the consultation, and has it been made available if so?	The FDP was not requested by the public during the consultation - however POEPL would be willing to release FDP related information if required to address a comment but with any commercially sensitive information redacted.	==
DMR5	2.4.1: Page: 80: Spurious chapter ref to "Chapters 0, 11.0 and 0" – clarify.	The references are incorrect and should read Chapters 10.0, 11.0 , 12.0.	All links to Chapters, Sections, Figures and Tables have been checked in the final document is compiled.
DMR6	3.1.6.3.1: Page: 89: It would be preferable to refer to the Offshore Minerals Ordinance 1994 as ""The Ordinance"" rather than ""The	POEPL agrees the re-wording would be clearer.	Relevant text amended

Consultee	Representation	POEPL response	Amendments/further detail
	Regulations"" in future documents, to avoid confusion with the subsidiary legislation (Offshore Petroleum (Licensing) Regulations 1995 & 2000).		
DMR7	3.2.17: Page: 104: Does POEPL view the change of a significant project contractor as a 'material change' for the purposes of the EIS?	Contractors will be required to deliver to POEPL's Design Philosophies and the additional detail provided in the Basis of Design and Functional Design Spec which have already been agreed for the project. The EIS does not refer to specific contract providers and a change of contractor is not seen as a material change unless it is accompanied by a significant design change which for the key environmental aspects would change. We would discuss the implications of a change of contractor in detail with FIG.	==
DMR8	4.3.2.2.2: Page: 114: Has the Design Notification document (referenced in this para) been requested by the public as part of the consultation, and has it been made available if so?	The Design Notification was not requested by the public during the consultation - however POEPL would be willing to release information related to the Design Notification if required to address a comment but with any commercially sensitive information redacted.	==
DMR9	Table 19: Page: 120: General comment: this table is not very clearly written. There is a mixture of: - Items that have been clearly ruled out with a clear explanation as to why - Items that are implied as being ruled out but are still 'being investigated'. Clarity on these is required e.g., a pilot- free flare design, which would have a significant impact on emissions, is still being investigated. If it is being investigated when will clarity on its use become available? This example	Operational flaring in the EIS accounts for 5% of the GHG emissions from the FPSO, about 3% of the overall total. We have minimised volumes of flaring by choosing a design with flare gas recovery and having the ability to reinject gas if necessary. Pilot-free flare has been rejected as a base-case choice for the project because we do not have enough evidence on its reliability in offshore operations in a similar setting, and hence whether it meets the required levels of safety performance as safety-critical equipment that safely burns gas in the event of a rapid depressurisation of the plant. We are noting our commitment to investigate it further but cannot make any further commitments until more design work is completed. We will seek agreement with the Harbour Master that a foghorn is superfluous in light of the range of other anti-collision measures, and we expect this to be undertaken prior to operations e.g., alongside planning consultations for the mooring buoy. It is relevant to note that our Country Manager received an email from Byron Marine on 11th January 2018 as part	==

Consultee	Representation	POEPL response	Amendments/further detail
	would have a measureable effect on reducing emissions. - Items that are not clearly worded e.g., "Noise from the foghorn will be discussed with the Harbour Master if it is considered a nuisance and other warning devices are considered suitable". Does this mean that a foghorn being proposed, or not being proposed, or is it subject to further consultation, or is POEPL waiting to see if anybody complains about it after installation? This example has been flagged previously as a potential concern.	of our early consultations stating that they did not see a need for a foghorn at the Mooring Buoy.	
DMR10	Table 19: Page: 120: 10.3 contradicts what is said on page 142 on cuttings disposal in the event of a TCC malfunction (see comment below on 5.4.5.3.2)	This is a high-level statement around overall management of cuttings i.e., that thermal treatment and discharge under permit is our chosen solution for cuttings. In 5.4.5.3.2. we expand on the unlikely contingency of a failure of the equipment resulting in a need to temporarily return cuttings to shore. This is a very unusual circumstance and the cuttings treatment is planned and executed as a highly reliable system that is built into the choice of the drilling rig and its deck layout. It has a certain amount of buffer capacity and critical spares are stored either on the rig or at the supply base. There will be an ongoing stream of materials being moved to and from the rig and the supply base, but if storage of cuttings at the supply base was unacceptable for some reason, the operation would be suspended until it was resolved.	==

Consultee	Representation	POEPL response	Amendments/further detail
DMR11	5.4.5.3.2: Page: 142: Strategy in the event of TCC malfunction is quoted as skip-and-ship, initially on the rig, then to shore, and with possible international export. This is listed as a discounted measure in Table 19, page 120. Which is correct? Would suggest a clear commitment is added that in no circumstances will untreated OBM cuttings be discharged, and if necessary operations would cease pending reinstatement of TCC capability. In the event of ship to shore transfer and storage of oiled cuttings, further consideration would be needed on the logistics and safeguards for unloading, storage and reloading, given challenging metocean conditions, and an assessment would be required of how an accidental cuttings discharge to sea would be dealt with both during transfer offshore and at the TDF in Stanley Harbour.	Discharge of untreated OBM cuttings is not stated as it is illegal. In 5.4.5.3.2 we state that either cuttings will temporarily be shipped to shore, or operations will cease as described further above, and this point could be made more clearly. Unloading cuttings in skips at the TDF would be within the normal envelope of operations. The loss of OBM offshore is assessed and the impacts also reflect the potential loss of OBM cuttings, in the unlikely event of the need to offload cuttings coupled with a failure of lifting gear or containment. POEPL also carries out a rig containment audit prior to hiring the rig, and as an example for the ENSCO100 rig used recently for the Catcher Development in the UK, POEPL required Ensco to improve the layout of the cuttings handling area and install additional bunding, covers and walkways to ensure the cuttings handling had a high level of containment (pictures are available). Any spills at the TDF will be covered by the Stanley Harbour Oil Spill Contingency Plan. The Stanley Harbour Oil Spill Strategy includes chemicals handling such as oil based mud in section 2.1.3. Practically, the oil in OBM is bound into the mud matrix and while it may give rise to a sheen, most of the oil would sink straight to the seabed with the dense cohesive mud.	Text amended to clarify the options in event of a TCC malfunction
DMR12	10.5.2.3: Page: 644: Does not consider additional noise contribution from maintaining station when OLST is bunkering in vicinity of mooring buoy - this will take place every two months, even once number of transfers has decreased, the need to refuel the OLST will	POEPL agrees that 'in the vicinity of the mooring buoy' is unclear and should read 'at anchor in the vicinity of the mooring buoy'. The proposal to bunker at anchor is noted in sections 10.3.2, 10.3.4 and Table 136. Practically, there is also the option of connecting to the mooring buoy for bunkering which avoids the impact of anchoring but which increases the duration of thruster	==

Consultee	Representation	POEPL response	Amendments/further detail
	remain and so the noise of thrusters and from bunkering vessel will need to be included.	noise. We will consider the impacts of any additional manoeuvring on DP in the updated noise modelling report. More information on bunkering of the OLST is given in 'Additional Information' DMR12-13.	
DMR13	12.2.4.3.2: Page: 1196: 2016 QRA for accident frequencies didn't account for additional operations inshore such as OLST bunkering. This should be incorporated.	It is agreed that the QRA did not cover this specific task, but the risks are very similar to those included in the assessment from the MRSV and ISV working in close proximity to the tankers. Bunkering would add a very small number of vessel hours to the total, from well managed activities, where the OLST is empty of crude oil and with little fuel cargo. This would not change the ranking of the assessment. See 'Additional Information' DMR12-13.	Subsea construction vessel noise is typical of general vessel traffic mentioned in 10.4.2.3. A greater degree of analysis has been undertaken for the more significant sources of noise such as piling and tanker thrusters. There is data on pipelay vessels and other installation vessels available that could be added to the narrative. Data on typical underwater equipment is more difficult to find, but recent measurements of underwater cutting for example found it to be difficult to discern above background noise [Underwater sound measurement data during diamond wire cutting: First description of radiated noise. Proc. Mtgs. Acoust. 27, 040012 (2016); https://doi.org/10.1121/2.0000322 Tanja Pangerc, Stephen Robinson, Peter Theobald, and Liz Galley]. Underwater noise from subsea well severance has recently been measured in the Southern North Sea but this is not yet published (*pers. comm.* BMT Cordah).

Consultee	Representation	POEPL response	Amendments/further detail
DMR14	15.3.2: Page: 1327: Should changes to the EMMP scope be possible with agreement of the majority of stakeholders rather than "all"	Groups like SOTEAG work by agreeing a consensus and we will involve SOTEAG experience in setting up the EMMP. The statement is one of intent and the governance of the EMMP would be drawn up in more detail. A majority voting system, when different parties have different responsibilities, could be very problematic.	==
DMR15	Table 329: Page: 1334: Oil spills - project-specific "regular oil spill response exercises to be conducted" -this is a legislative requirement	Agreed, these requirements will be built into our Oil Spill Contingency Plans. We expect these to include regular exercises where lines of communication and reporting are tested and more detailed 5-yearly exercises of a major incident.	==
DMR16	Table 332: Page: 1338: Offshore seabirds and benthic sediments are not aligned with monitoring, is there a particular reason for this (benthic fq explained in text but not the disparity b/w the two)? Regarding seabirds in particular, given the commitment to monitoring seabirds through observers should this not be occurring more regularly than every 5 years, as is the case for marine mammals and appears to be detailed in 15.5.1.1?	Correct, more frequent monitoring for seabirds will occur at the start of the project when support vessels will be equipped with seabird/marine mammal observers. As observations and experience builds up, monitoring frequency is expected to diminish. Table 332 has been updated - 'Additional Information' DMR16-20."	Updated table (Additional Information DMR16-20) inserted into text
DMR17	Table 332: Page: 1338: There is no baseline in the table for inshore benthic sediments, should this be added for clarity in the pre-sanction phase to cover the BS/SH baseline survey completed to date?	There is a pre-existing baseline for inshore benthos described in the EIS Chapter 7 and Table 332 has been updated to reflect where substantive baseline data already exists.	Updated table (Additional Information DMR16-20) inserted into text
DMR18	Table 332: Page: 1338: Footnote explaining that the Loligo ongiong monitoring may occur dependent on collaboration with FIFD and results from baseline?"	POEPL acknowledges the point, investigating squid spawning grounds is included in EMMP and a collaborative project currently under discussion *via* GAP II programme.	==

Consultee	Representation	POEPL response	Amendments/further detail
DMR19	Table 332: Page: 1338: Why is there a gap between marine mammal baseline and monitoring during the development drilling phase?	POEPL recognise the discrepancy and we have updated the EMMP Table 332 as attached 'Additional Information' DMR16-20.	Updated table (Additional Information DMR16-20) inserted into text
DMR20	Table 332: Page: 1338: Onshore Air quality and Offshore emissions also have monitoring with no apparent baseline - please can this be explained in the text?	Inshore air quality will need a baseline for VOC and odour and should be added - see update to Table 332. Offshore emissions are to do with efficient operation of the combustion plant reflected by NOx, SOx and other gases, and are relative to the global atmosphere baseline hence no site-specific baseline.	Updated table (Additional Information DMR16-20) inserted into text
DMR21	15.6.3.4: Page: 1352: Should this scope of work include timing of spill exercises and/or equipment testing/maintenance or is that beyond EMMP?	This is normal operational practice and included in the OSCP and operational management processes rather than EMMP activities we would suggest. Nevertheless, it would be beneficial to ensure the EMMP steering group was aware of these activities and POEPL would be happy to facilitate their understanding and receive questions and feedback.	==
Falkland Islands Government, Environmental Planning Department (EPD)			
EPD1	Although seabirds and marine mammals are addressed separately, conservation sites are less sensitive during the winter months (May to August). This only is listed for sensitivities at Sea Lion. Site sensitivity for conservation sites is the same (High) year-round. To resolve this either give a clear explanation on why there is a monthly variation in site sensitivity and why or change this to highly sensitive year-round. This was not reflected on in the corresponding text.	POEPL understand the point being made and clearly the sensitivity of important features within the sites could be lower during the winter months, when one considers for example the islands/protected areas that host important seabird breeding colonies. However, when one considers the conservation sites collectively, including the habitat attributes and terrestrial components (IPAs), then they could be considered sensitive year round, and damage to the habitat itself could have consequences that span across seasons.	These tables are summaries of summaries and are necessarily at a very high level. It is not possible to condense all the information presented into a single High, Medium or Low category that will be relevant to all receptors.

Consultee	Representation	POEPL response	Amendments/further detail
EPD2	Decommissioning on the table is noted by a footnote "f" which is not referred to anywhere else.	'f' = not relevant to this document as it is in the decommissioning scope.	==
EPD3	Underwater noise is not an identified environmental aspect for "subsea works". Although pile-driving is included in the EIS, further work should be done to assess sources of underwater noise during all subsea work.	Subsea construction vessel noise is typical of general vessel traffic mentioned in 10.4.2.3. A greater degree of analysis has been undertaken for the more significant sources of noise such as piling and tanker thrusters. There is data on pipelay vessels and other installation vessels available that could be added to the narrative.	POEPL agrees that 'in the vicinity of the mooring buoy' is unclear and should read 'at anchor in the vicinity of the mooring buoy'. The proposal to bunker at anchor is noted in sections 10.3.2, 10.3.4 and Table 136. Practically, there is also the option of connecting to the mooring buoy for bunkering which avoids the impact of anchoring but which increases the duration of thruster noise. We will consider the impacts of any additional manoeuvring on DP in the updated noise modelling report. More information on bunkering of the OLST is given in 'Additional Information' DMR12-13."
EPD4	Why were cetacean collisions not a matter of stake-holder concern?	Figure 4 is not intended to imply that marine mammals are not a matter of stakeholder concern, which they clearly are. Marine mammal collisions are recorded as an issue in both parts of the table and relate to vessels which is intended to reflect any of the stages of marine operations.	==
EPD5	No reference is made to sensitivities of human well-being assessed in the SEMP report. This ideally should be addressed here and the impact assessed in the document in more detail.	Well-being as such is not listed in the EIS Guidance, but we have included human health in relation to disturbance due to noise and health thresholds for air quality impacts.	==

Consultee	Representation	POEPL response	Amendments/further detail
EPD6	Why is there no assessment of the impact of an inshore spill on surrounding archaeology? Due to the long-lasting effects of an accidental spill and the importance of archaeological artefacts in cultural history, very little mention is made of the effect of a spill.	POEPL don't remember this issue being raised by stakeholders and it was not identified in the ENVID. Wrecks in Berkeley Sound and in marine waters are fully covered by water and unlikely to be affected by Sea Lion crude oil.	==
EPD7	The phrase "meaningful" is mentioned throughout the document. There is no definition given for the term and leaves room for potential inappropriate interpretation. In each instance there should be an appropriate definition provided or a clearer restructuring of the wording to provide clear interpretation of the document.	These are either: from FIG Guidance; or can be removed; or changed to 'significant' or 'accurately'. 1.7.3 quotes FIG Guidance 3.1.6.2 remove 5.12.3 change to possible 7.4.5.2.1.3 significant 8.9.1 quotes FIG Guidance 10.8.4.2 change to significant 10.9.4.5.3.2 remove 10.9.9 change to relevant 10.11.4.3.2 remove 11.12.4.4.1.5 remove 11.12.9 change to accurately 12.1.4.3.3.1 change to significant, and relevant 12.2.4 remove 12.2.4.4.4 change to relevant 13.1 remove	Quotation marks added where relevant, all other changes applied.
EPD8	Only one mention of remediation is made in the document and this is not expanded on, nor a mention of POEPL's obligations under any spill scenario.	EIS Appendix A states that "The need for remediation efforts will be determined based on the outcomes of monitoring. The detailed POEPL monitoring strategy will be established during the Environmental Monitoring and Management Plan (EMMP) workshop." Within topics such as seabed disturbance and drill cuttings deposition we discuss recovery of the seabed, and the facilities are designed to be removable. Remediation related to oil spills is one example and POEPL would work within the NOSCP. This includes a net environmental benefit analysis to identify the most environmentally beneficial remediation options which are	==

Consultee	Representation	POEPL response	Amendments/further detail
		decided after an assessment of the specific conditions of the spill in question and its relation to sensitivities, time of year, ongoing risks etc. Provision for financial liabilities relating to oil spills is covered separately to the EIS as described in FIG EIS Guidance 187/15. Substantial sums are provided for in insurances and compensation schemes. Correspondence on the level of financial provision is provided under 'Additional Information' EPD8.	
Falkland Islands Government, Directorate of Natural Resources, Fisheries Department (FIFD)			
FIFD1	On page 60 of the EIS, it mentions that "An Oil Spill Contingency Plan (OSCP) that covers the offshore operations will be submitted to FIG before operations commence". Why is this contingency plan not available now? It seems like it should be part of the EIS on which POEPL will be evaluated as to whether they can properly respond to an oil spill. They should not be cleared to move on with this project without an approved contingency plan in place.	Oil Spill Strategies have been prepared as agreed with FIG including Offshore, Inshore and Stanley Harbour Oil Spill Strategies which have been submitted to FIG. These strategies detail all the main items of equipment and response methods. These provide a clear basis for the development of Oil Spill Contingency Plans which will require FIG approval before operations can commence.	==
FIFD2	On page 442 of the EIS and page 27 of the NTS, offsetting of impacts through a "meaningful" contribution into an Environmental fund is mentioned, but it seems important at the offset to establish a definition for "meaningful" and to define a process on how this level will be determined. We assume that this will discussed with FIG representatives, but more clarity seems necessary in the EIS. However, we do recognise that any	This wording is from FIG paper 124-16P and the offsetting approach has been discussed with FIG. POEPL has prepared an Environment Fund Briefing Note that has been submitted to FIG describing the basis of the contribution which has been accepted.	==

Consultee	Representation	POEPL response	Amendments/further detail
	offsetting for impacts on Fisheries related issues will need to be negotiated or discussed with FIG or the Committee administering the Environmental fund and not POEPL directly.		
FIFD3	In the oil tests summary table (page 1075) it mentions first that the crude is solid and resists physical breakup into smaller particles, but then says that it will remain in the environment as solid components (for at least seven days) until eventually breaking up and biodegrading. Seven days is not very long for an oil spill response, especially if there's bad weather, and therefore it seems like there's a chance that some large percentage of the oil will break up and not be recovered from the environment.	POEPL agrees that there is a risk of oil dispersing into the environment, and natural dispersion is often quoted as a deliberate strategy in oil spill response generally; nevertheless, POEPL has invested in optimising methods for recovering oil relating to potential inshore releases of crude oil, and expects this to be have moderate to high effectiveness for small spills based on modelling and case studies for locations with a similar state or preparedness. The oil remained in solid lumps fo 10 days in the CEDRE Polludrome under moderate and high energy conditions. The OSCAR modelling predicts that a fraction of the oil is not recovered, dependent on weather and light, and does migrate into the wider environment, and this is acknowledged in the impact assessment. Offshore, mechanical recovery has very limited efficiency due to sea state and an average recovery rate of no more than 12% is expected for a prolonged blowout for example. Prevention of releases is of prime importance.	==
FIFD4	Although obviously difficult to do, but testing on the effect of oil on eggs of local fish species would be much better than using zebra fish. There are facilities on the islands that may allow research to take place here on the effect of oil on toothfish, rock cod or even squid eggs. Furthermore, it seems like the biodegradation of the crude oil here is possible after a week or two. In that case, it is important to test the toxicity of the crude in both on fish eggs after degradation as well	Zebrafish are standard laboratory animals and give us standardised results in the same way as the algae, plankton and crustacean tests that have been undertaken. This enables POEPL to assess the toxicity versus other substances, and the results are consistent in that the crude oil is very low toxicity with a very low fraction of soluble components that are most harmful to aquatic organisms. The physical characteristics strongly point to the oil remaining floating and away from the seabed and main water column where most eggs would be found. POEPL has committed to looking at toxicity towards squid eggs (15.6.1.2). The zebrafish test is a standard laboratory test for ecotoxicity and is comparable to the testing and assessment of chemicals offshore that uses three standard aquatic species plus a sediment reworker to draw conclusions on wider risks to the environment - which we have also performed on the	==

Consultee	Representation	POEPL response	Amendments/further detail
	as while it is still solid. If this has been done and we've missed this, disregard this comment, but fisheries being so important here it is very crucial that we make sure we are not unduly endangering the resources.	crude oil at CEDRE. The uncertainties across species and ecosystems are normally incorporated in an 'assessment factor' which is used to deduce a no-effect concentration from LC50 or EC50 results, which could be 100 or 1000 times lower than the LC50 or EC50. The approach to assessing wider ecosystem risk is documented in the European Technical Guidance Document on the Risk Assessment of Chemicals (EU-TGD, https://echa.europa.eu/documents/10162/16960216/tgdpart2_2ed_en.pdf). However, in the laboratory tests, it was impossible to reach an LC50/EC50 level in some cases even with the use of extremely high concentrations of oil in water (percent levels) to generate water-accommodated fractions. This low level of toxicity, combined with a precautionary approach to impacts and examining concentrations of oil down to 25 ppb in POEPL's predictions are believed to give precautionary and defensible conclusions on aquatic toxicity. POEPL are also completing testing on juvenile turbot at CEDRE (Scophthalmus maximus). OSPAR recommends the test species Scophthalmus maximus (juveniles); or Cyprinodon variegatus (juveniles) for testing of offshore chemicals, and it is a standard species for obtaining generalised toxicity data as above. The recommended test protocol is the PARCOM Protocol 1995 part B (https://www.cefas.co.uk/cefas-data-hub/offshore-chemical-notification-scheme/ocns-ecotoxicology-testing/). This testing was delayed due to additional European controls and permits required for testing on higher animals and will be completed in April 2018 but POEPL do not expect the results to alter the overall conclusions.	
FIFD5	It does not seem clear how prioritisation of activities in Berkeley Sound will be determined. For instance, if Berkeley Sound is required for a number of fishing vessels and POEPL has arranged a transfer, how will prioritisation be determined? Who will have a say?	POEPL would defer to the Harbour Master who has responsibility to approve each STS transfer taking into account other users. POEPL's assessment of existing vessel movements and anchorage is that the 500m permanent exclusion zone, and the temporary 1500m zone plus 2000m approach channel will not present a significant impact.	==

Consultee	Representation	POEPL response	Amendments/further detail
FIFD6	Regarding charter flights, there seems to be an opportunity for POEPL to work closely with the fishing industry as many companies transfer crew *via* Europe and could make use of additional seats on charter flights if these were available. Perhaps this can be followed up with FIFCA.	POEPL appreciate this suggestion and we seek to build on the arrangements during the exploration wells campaign when charter flights were used for mutual benefit. Very happy to follow up with FIFCA as work proceeds.	==
Shallow Marine Surveys Group (SMSG)			
SMSG1	There is a need for a better description of the audit process of mitigation plans. It's fine to describe what if any, mitigation will be in place, but how will these be monitored/audited? Internally? Externally? This plan may not be fully developed, and in that case, it should be more clearly explained what the 'next steps' are and POEPL's expectations for auditing mitigations.	POEPL agrees that an important function of the EMMP is to review the efficacy of the mitigation measures. 15.1.2 of the EIS states "Where the proposed EMMP programme indicates that the mitigations proposed have not been appropriate or do not deliver the level or value expected in the impact / risk assessment, or are unnecessary, the EMMP Steering Group may assess whether a revised mitigation or measure is needed or a particular measure is no longer required." Performance and monitoring data will be reviewed regularly and mitigations may be removed, added or amended dependent on the results obtained by monitoring and/or on receipt of relevant scientific information. The way in which the EMMP process will operate is outlined in Chapter 15 of the EIS and will be discussed in more detail at the EMMP workshop and will include reference to other such groups around the world. POEPL are conscious that the EIS has a 5-yearly period of validity under the Offshore Minerals Ordinance and would undergo a thorough review at such intervals, informed heavily by the ongoing working of the EMMP group and the results of monitoring of mitigations. POEPL's operations are certified to ISO14001 which includes internal and external audit of its environmental processes and significant impacts and monitoring."	
SMSG2	Similarly, the ALARP concept needs more detailed explanation. POEPL's risk management appears to be	ALARP is a well-defined concept under UK and international HSE regulation and is a central part of POEPL's HSES Risk Management Standard for all its operations, where ALARP is defined as "As Low As Reasonably Practicable,	==

	heavily dependent on the ALARP concept and as such, it's important for the reader to assess this in more detail and understand its practical implications. for example, is this internally or externally reviewed? By who? How often? A short definition including practical implications in the Falklands case would be very helpful.	which means that after reviewing all possible alternatives, further risk reduction would involve disproportionate cost or use of resources for the risk reduction that could be achieved". In the context of the EIS it is summarised in Section 8.2 "Ultimately, the aim of all mitigation is to reduce the overall impact or risk associated with an activity to a level that is 'As Low As is Reasonably Practicable' (ALARP), irrespective of whether this is achieved by prevention, reduction and / or remediation. Very importantly however, 'ALARP' is not synonymous with 'Low' and the concept takes into account the balance between the costs and benefits of a mitigation measure. Here it is recognised that while it may be possible to reduce an impact or risk further, the process of doing so may require excessive time and resource such that it is not considered 'reasonably practicable' in light of the benefits that can be gained." Further elaboration of ALARP can be found in (e.g.) Health and Safety Executive documents 'Reducing Risk Protecting People (2001)' and 'ALARP at a Glance' and 'Policy and guidance on reducing risks as low as reasonably practicable in design'. POEPL are conscious that the EIS requires a 5-yearly period of validity and would undergo a thorough review at such intervals, and re-approval would require oversight by FIG and its scientific advisors who would externally review the level of risk management. As a project-specific example: Project vessels entering inshore waters pose a risk to biosecurity. It is clearly reasonably practicable to follow international protocols for ballast water and biofouling that are designed to manage such risks. For vessels that are to be present inshore for some time presenting a higher degree of exposure e.g., the Large Transit Vessels in Berkeley Sound, it is considered reasonable also to undertake a hull inspection prior to its journey to the Falklands as part of the vessel audit process. For Conventional Trading Tankers, they are present for a much shorter time, and the costs of going beyond the international standards would be disproportionately high in relation to the risks, and hull inspections are not considered ALARP, but audit of their control systems prior to entry is considered reasonably practicable, as is taking samples of ballast water to monitor the efficiency of their ballast water systems, which are both above international standards.	

Consultee	Representation	POEPL response	Amendments/further detail
SMSG3	The significance of kelp forests is significantly under-represented. in some cases, baseline evidence presented here is not fully utilised. as such, risk analyses based on marine flora are likely to be underestimated.	The significance of kelp is highlighted in Chapter 7 (environmental baseline), both in terms of its role as a primary producer, and also as a keystone species providing habitat for other species. It is assessed as MEDIUM sensitivity in its Berkeley Sound component. We highlight that the distribution of kelp is an important consideration in respect of possible oil spill scenarios, but indicate that compared with the East Falkland coastline as a whole, Berkeley Sound has relatively low kelp coverage, and impacts on kelp from oil spills in the literature are relatively modest.	==
SMSG4	The impact of off-shore spills on the planktonic assemblage is understated. the only testing done (zebrafish eggs) is not A robust test necessarily, and as such knowledge of this impact is A significant knowledge gap. the risks associated with impact on the planktonic assemblage is likely to be underestimated.	The test on zebrafish is to an internationally recognised standard for industrial effluents, and is used as an indicator more generally for relative risk to early life cycle stages of fish. POEPL understand that larvae are more sensitive than eggs. POEPL use a threshold of 25 parts per billion to report and assess oil concentrations in the water column, whereas the applied dose in the zebrafish egg test of 8.8 parts per thousand (a factor of 350,000 higher than the assessment threshold) produced no observable effect in the hatching success of zebrafish eggs, and 97% of the larvae were healthy. POEPL therefore believe the testing and assessment give us a very precautionary position and we do not believe that further oil testing would alter the assessment.	==
SMSG5	Although the EIS identified interaction effects of impacts as being A knowledge gap, this lack of knowledge does not appear to have been included in the defined “precautionary approach” to risk identification and management. this suggests that the impact/risk matrix scores across and number of receptors may be underestimated.	See responses to SMSG35 and SMSG36.	==
SMSG6	Layout could be more user-friendly. The size of the document in its present form is quite unwieldy and difficult to use, particularly with the	POEPL need to be conscious that some recipients rely ultimately on a paper format for the EIS but recognise that adding electronic bookmarks could help the document to be more user-friendly.	The electronic version of the EIS has bookmarks, to aid navigation.

Consultee	Representation	POEPL response	Amendments/further detail
	large amount of cross-referencing and the need to compare methods (e.g., assessment methods) to results (e.g., final assessment scoring) in each section. The nature of the document would necessarily mean that some effort will be required by the user. However, ease of use would be significantly improved by using modern PDF facilities such as Tabs or Bookmarks. I do note that many figures and tables have hyperlinks, which was helpful.		
SMSG7	Can a DATE be included on the cover or a publisher page? Date of Public release? Date of end of 42 day consultation?"	POEPL agrees - it would be sensible to mark the submission and approval dates on the EIS and any further information that supports it as an output from the ExCo approval process.	==
SMSG8	Has there been internal/external review of the document prior to release of this version?	There have been multiple reviews of the document internally by POEPL and its advisors SAERI as part of their respective QA and technical review processes. FIG have also undertaken a compliance review of the document and a scientific review of the document using their appointed technical reviewer SAMS.	==
SMSG9	Tables 31 – 38 are miss-numbered. Should be 300 and something.	POEPL Agrees, the contents should be numbered Table 326-333.	Corrected.
SMSG10	Table 12, Element 9 and 10 indicate that there will be processes developed for monitoring, audit and review. It seems this is internally driven; is there an external, independent element to auditing of monitoring processes?	POEPL has internal processes for monitoring, audit and review to which this table on its HSES Management System refers. POEPL's operations are certified to ISO14001 which includes internal and external audit of its environmental processes and significant impacts and monitoring. Via the EMMP there will be external review of monitoring relevant to the scope of the EMMP. FIG will exercise it normal legal duties regarding review and inspection of POEPL's plans and operations *via* its regulatory functions.	==

Consultee	Representation	POEPL response	Amendments/further detail
SMSG11	Is there external review of the ALARP? This also seems internally driven. The whole EIS (assessment, mitigation and monitoring processes) seems to depend heavily on the ALARP concept. The EIS explains that ALARP decisions are guided by the FK-BU-PMO-HS-STD-0006. This document provides a definition, but does not provide details of the mechanism of its assessment. This is particularly important for assessing the risk to environmental receptors that cannot be easily measured in a cost/benefit way. For example, assessment of risk to environmental features or processes should necessarily be inclusive of the cascading effects of impacts that may have long-term impacts a number of receptors. Weighing up costs against such impacts would not may not necessarily be captured under the current application of ALARP it seems. Additionally, the ALARP concept would not work for ecological risks where there is a declared lack of information – in other words, how is ALARP applied in a precautionary way in the absence of supporting information?	The EIA is driven by its methodology that includes the ALARP concept. Uncertainties in data are inherent in all forms of risk assessment and are routinely managed quantitatively and qualitatively. Some uncertainties in ecological risks are simply a feature of the receptor and are part of normal assessment process e.g., large natural variabilities in population size, and risks and mitigations take this into account. Other uncertainties are around a lack of knowledge and these have been methodically documented in the assessment chapters and logically reviewed in terms of screening topics for inclusion in the EMMP process. The assessments include cumulative and long-term impacts where appropriate.	==
SMSG12	6. 5.8.5.4.1. In the event of discharge to the sea, is FIG informed of this	Planned discharges to sea are done under a specific permit and reported against according to the requirements of the permit, which could include	

Consultee	Representation	POEPL response	Amendments/further detail
	prior to discharge? Or a report post-discharge?	daily analysis of produced water that are reported to FIG on a monthly basis for example. Drilling discharges under permit are normally reported at the end of the well. Unplanned discharges must be reported without delay, which is normally interpreted to be within 6 hours. Any discharges that have a permit, but which do not comply with the permit, are reported promptly (normally within 48 hours) unless they pose a significant immediate risk in which case they are reported within 6 hours. Such reports are made using standard reporting forms and are followed by a more detailed investigation report into the incident that concludes the exact details of the unplanned or non-compliant discharge along with root causes and actions to prevent recurrence.	
SMSG13	The role and importance of kelp forests in the Falklands is understated. Ecological importance (biodiversity, fisheries) of kelp forests are presented well. However, lacking is the importance of kelps (primarily Macrocystis) in their role as a mechanical buffer to the effects of waves and storms on coastal geomorphologic structure and habitats the coast supports. Loss of giant kelp forests could result in irreversible changes to shoreline geomorphology, which in turn could have dramatic irreversible effects to shore-based bird, mammal, and plant assemblages. In addition, kelp forests are likely to be significant carbon sinks in the Falklands, implying much broader-scale and long-term importance of kelp forests. Finally,	This point is similar to SMSG3 and our response applies. The significance of kelp is highlighted in Chapter 7 (environmental baseline), both in terms of its role as a primary producer, and also as a keystone species providing habitat for other species. POEPL acknowledges that these additional attributes (buffering shoreline from wave action, carbon sinks, and commercial potential) are useful additional commentary that would inform the relevant sections of the Environmental Baseline chapter.	==

Consultee	Representation	POEPL response	Amendments/further detail
	there is consistent interest in kelps for commercial exploitation in the Falklands; although not currently exploited it is important to consider this as an important economic feature of kelp forests. These should be highlighted as being additional critically important features of Falkland kelp forests. See "Smale *et al.,* 2013, Threats and knowledge gaps for ecosystem services provided by kelp forests: a northeast Atlantic perspective", and "D.T.I Bayley, I. Marengo and T. Pelembe, 2017. Giant kelp 'Blue carbon' storage and sequestration value in the Falkland Islands. SAERI". (both attached)		
SMSG14	The Environmental Sensitivity Index (ESI) assessment is based on physical attributes of the shoreline, as indicated in Table 85. However, it should be made more clear that biological/ecological attributes are NOT used in the sensitivity test. It is somewhat confusing that despite Table 85, bulleted points on pg 433 say that "General biological productivity and sensitivity" should be integrated into the ESI.	POEPL acknowledges the issues around the use of this classification system and its use of the word 'sensitivity' which has differences in meaning between the EIS methodology and the specific meaning within the ESI classification system. It is in some respects a very broad descriptor but which is nevertheless widely used in the world especially in the context of response to oil spill incidents. It relates physical characteristics to ecological vulnerability or robustness and recognises that by correlating these aspects it is possible to make a rapid initial step in prioritising oil spill response. 7.6.2 and 7.6.3 acknowledge that the system requires further information e.g., "In addition, it is important to understand and map the location of internationally recognised sites and nationally designated sites of environmental importance to identify sensitive ecosystems, critical habitats and endangered species. Therefore, to highlight environmentally sensitive areas within the coastal zones adjacent to Berkeley Sound, the occurrence of nationally protected areas and the known locations of key faunal and floral species have been mapped throughout this baseline chapter.	'General biological productivity and sensitivity' removed from the list of bullet points on pg 433

Consultee	Representation	POEPL response	Amendments/further detail
SMSG15	Environmental sensitivity. It is then described how bird colonies overlap with the ESI. However, it goes on to say that "Additional species and taxa were not considered either due to a lack of quantitative data that could be extrapolated to un-surveyed coastlines or to a widespread distribution across the coastal habitat types." This does not seem to be true in the case of kelp forests, where it was presented above that kelp forests are important coastal features and have been mapped across the target areas. Coverage of this data seems adequate to include in the ESI assessment, as shown in "Figure 67: Kelp coverage around the East Falkland coastline". A discussion on the overlap of ESI and kelp forests should be included.	The sensitivities of kelp have been included in the assessment and we must also recognise that kelp has characteristics that may also be dissimilar to aspects included in the ESI for neighbouring coastline. Going forward, the mapping of ecological features for the detailed oil spill contingency plans will be required, along with coastal inspections to site potential booming points, and incorporation of more detailed mapping of kelp (taking into account its temporal variability) would certainly be relevant at that point both in terms of protecting more sensitive components but also in managing the physical response most effectively.	==
SMSG16	Sensitivity of Berkeley Sound coast to inshore oil spills – there is a great deal of quantitative biological/ecological data that could be included in the interpretation and/or application of the ESI for Berkley Sound, as presented in earlier sections of this report describing shoreline floral and faunal surveys. Can there be some more detailed commentary on the ESI and	POEPL believe that while the inter-tidal information in the EIS is adequate for the assessment, further inter-tidal work is necessary to establish a monitoring baseline post- approval and such work would support more detailed coastal sensitivity plans. Such inter-tidal work is an important commitment in the EMMP (Section 15.5.2.3). We note that additional mapping of coastal bird sensitivity was included in the Inshore Oil Spill Strategy and complements the ESI data and we attach a page from this strategy in 'Additional Information'. POEPL has been given access to the oil spill contingency plan mapping for Sullom Voe Oil Terminal and while permission is required from its owners, we hope to be able to use this (and other such information) to help build the	==

Consultee	Representation	POEPL response	Amendments/further detail
	relationship with surveyed biological data from Berkeley Sound.	detailed maps required for the Inshore Oil Spill Contingency Plan post-Sanction.	
SMSG17	It may be that those biological/ecological data are not discussed because the resolution was still not adequate for ESI assessment. If this is the case, how has this lack of information affected the final use of the ESI assessment method? It should be stated more clearly what the limitations are of the current ESI based on available data.	Sensitivity mapping is a method used to identify the most sensitive sites or receptors to oil spill events, thus providing a basis for the definition of priorities for protection and clean-up, and information to plan the best-suited response strategy. Essentially, a sensitivity map will overlay the distribution of receptors and habitat types to summarise the information presented in the baseline. It is not a question of assessment. As above, two further sensitivity maps are relevant. More detail on sensitivity mapping for oil spill response can be found here, which is referenced in the EIS: http://www.oilspillresponseproject.org/wp-content/uploads/2016/02/GPG-Sensitivity-Mapping.pdf	==
SMSG18	The second column is headed with “planned events” – presumably this is meant to be “unplanned events”? Is this a typo?	No, this is correct. The EIS distinguishes between risks and potential impacts associated with planned events (e.g., noise), versus accidental (unplanned) events (such as oil spills). The latter incorporates an assessment of the Likelihood of the Unplanned Event occurring.	==
SMSG19	In the 2nd paragraph of this section, the strategy for planned events and unplanned events is broadly outlined, but there is seemingly no strategy for accidental events. Although the identification and assessment of accidental events is bundled with unplanned events in the previous section, is the same strategy for reducing risk and increasing mitigation the also the same for accidental events?	In Section 8.7, it is indicated that for planned events (i.e., those that will occur), mitigation measures should be aimed firstly at avoiding and reducing the impacts before considering options to remedy the impact once it occurs. In contrast, for unplanned (or accidental) events the priority is to minimise the likelihood of occurrence, followed by actions/mitigation measures to minimise the consequences of an event should it occur. These principles have been incorporated into the assessment process and identifying options for reducing risk.	==
SMSG20	Agree that this is sensible to improve mitigation if ongoing monitoring suggests that it’s necessary. Indeed equally, it could be that mitigation can be relaxed in those areas where	We agree with the comment and the approach taken.	==

Consultee	Representation	POEPL response	Amendments/further detail
	monitoring suggests that risks were over- estimated in the EIA.		
SMSG21	Regarding the observed increase in jellyfish in the Falklands, although true, it is somewhat misleading to relate this to increased marine debris as described in the first part of the paragraph. As its written now, it suggests a highly spurious connection and should be deleted – the increase in jellyfish in the Falklands could be for all manner of reasons and least of all marine debris.	We agree that increased jellyfish abundance in the Falklands does not appear related to marine debris. The ES references a study that did find a connection between hard substrate and debris and jellyfish but this is not linked directly to the Falklands. The wording could be clearer in this respect.	Relevant text reworded to reflect the comment.
SMSG22	This section needs more detail. The statement "Fish eggs and larvae are considered to be more susceptible to the toxic effects of oil than adults, due to their reduced ability to avoid contaminated water." is perhaps true per se, but it understates the critical issues. Eggs, larvae, and juvenile organisms occupy a variety of depths in the water column – some will naturally be in the path of oil contaminants, while others will avoid contamination due to their natural vertical distribution. Much more critical to the notion of vulnerability of eggs, larvae, and juveniles is the fact that they are very small, with high surface:volume ratios due their shape and appendages, and that their membranes are particularly thin with	Noted. Because POEPL has already acknowledged the increased susceptibility of fish eggs and larvae to the toxic effects of oil contamination compared to adults, this will not change the outcomes of the assessment process. POEPL agrees that additional wording around stock recruitment would be beneficial to interpretation.	Some relevant text is added to clarify this.

Consultee	Representation	POEPL response	Amendments/further detail
	high rates of passive and/or active diffusion across the membrane. Moreover, even very small concentrations of contaminants could be potentially lethal or sub-lethal and causing malformations during development. Such impacts may lead to significantly lowered stock recruitment in that year, having direct and indirect effects on commercial species and species supporting commercial stocks.		
SMSG23	Given the fact that testing was only done on one species – Zebrafish – a freshwater fish –would suggest that any risk assessment of Falklands marine eggs, larvae, or juveniles based on this single test has a very high degree of uncertainty. This weakness in the evidence should be described more clearly.	As noted previously, this test is a standard laboratory test for ecotoxicity and is comparable to the testing and assessment of chemicals offshore that uses three standard aquatic species plus a sediment reworker to draw conclusions on wider risks to the environment - which we have also performed on the crude oil at CEDRE. The uncertainties across species and ecosystems are normally incorporated in an 'assessment factor' which is used to deduce a no-effect concentration from LC50 or EC50 results, which could be 100 or 1000 times lower than the LC50 or EC50. The approach to assessing wider ecosystem risk is documented in the European Technical Guidance Document on the Risk Assessment of Chemicals (EU-TGD, https://echa.europa.eu/documents/10162/16960216/tgdpart2_2ed_en.pdf). However in the laboratory tests, it was impossible to reach an LC50/EC50 level in some cases even with the use of extremely high concentrations of oil in water (percent levels) to generate water-accommodated fractions. This low level of toxicity, combined with a precautionary approach to impacts and examining concentrations of oil down to 25 ppb in our predictions, give, we believe precautionary and defensible conclusions on aquatic toxicity. POEPL are also completing testing on juvenile turbot at CEDRE (Scophthalmus maximus). OSPAR recommends the test species Scophthalmus maximus (juveniles); or Cyprinodon variegatus (juveniles) for testing of offshore chemicals, and it is a standard species for obtaining	==

Consultee	Representation	POEPL response	Amendments/further detail
		generalised toxicity data as above. The recommended test protocol is the PARCOM Protocol 1995 part B (https://www.cefas.co.uk/cefas-data-hub/offshore-chemical-notification-scheme/ocns-ecotoxicology-testing/). This testing was delayed due to additional European controls and permits required for testing on higher animals and will be completed in April 2018 but we do not expect the results to alter the overall conclusions. POEPL are committed to further investigating the toxicity of the oil with respect to local squid eggs.	
SMSG24	Combining the above two observations, the sensitivity of the Plankton (phytoplankton, zooplankton, eggs, larvae, juveniles) receptor under any of the spill scenarios is likely to be underestimated in the assessment, or in the least not well assessed based on highly uncertain and incomplete data. This component of the assessment should be re-evaluated.	We believe that by examining concentrations of oil down to 25 ppb using recognised models, by having ecotoxicity testing carried out to recognised international standards and by using local and international expertise in evaluating of the potential exposures against the known sensitivities, we have a robust and precautionary assessment. The exposure of such communities to oil given the solid and buoyant nature of Sea Lion crude is likely to be small and it lacks significant fractions of soluble or PAH components. Uncertainties such as the location of squid spawning are acknowledged and taken forward in the EMMP.	==
SMSG25	In this sense, this risk should be included in Table 293 as the fate and impact as it relates to the planktonic assemblage is largely unknown.	Plankton is assessed as having a low sensitivity reflecting that it is a receptor of very high abundance and rapid reproduction. The ecotoxicity testing undertaken is in line with OSPAR testing for offshore chemicals which refers to the European Technical Guidance Note for Risk Assessment of Chemicals and which is used internationally for assessing risk to aquatic ecosystems as a whole through the testing of different trophic levels. The oil has been tested on algae and copepods and LC50 result of 20.7 g/l (20,700 ppm) was determined for Acartia tonsa and 39.7 g.l (39,700 ppm) for Skeletonema costatum. Risks to plankton can be considered well defined and low.	==
SMSG26	Better understanding of all types of spills on the planktonic assemblage should also be included in "12.1.10.1 Monitoring required", where there should be more ongoing real-world	POEPL do not agree that this is warranted given the extensive laboratory testing already undertaken and the nature of the receptor.	==

Consultee	Representation	POEPL response	Amendments/further detail
	testing of oil on the Falklands planktonic assemblage.		
SMSG27	Why are kelp forests not considered as significant receptors in this section on off-shore spills? Compare to data presented in Figure 67. Kelp forests should be included as receptors as they are likely to be significantly related to other ecological processes, including barriers to the shoreline from oil spills.	The EIS includes 'COASTAL' as an environmental receptor for offshore oil spills. For the two spill scenarios in which oil reaches the coast, the sensitivity is assessed as HIGH and the severity of impact MODERATE. The Coastal receptor does not explicitly include kelp, but is a more general ranking of sensitivity including kelp and the presence of IBAs, important colonies etc. The overall assessment has assessed potential impacts on the coastline habitat. We have undertaken oil testing on three different species of kelp and found zero adhesion of Sea Lion crude oil in the immersed state. POEPL acknowledges the respondent's concerns that EIS could more clearly present the importance of kelp as a valuable ecosystem component, and we fully agree that kelp forest represents a very important habitat in the Falkland Islands ecosystem. We do believe, however, that kelp has been assessed appropriately in the EIS with a proportionate level of scientific investigation. As per comments SMSG15, SMSG16 and SMSG17, the way kelp is included in detailed oil spill contingency plans will ensure it is represented and managed appropriately in the unlikely event that oil is released and moves into areas of kelp.	==
SMSG28	Table 284 – Are there guidelines for operations during storms? I may have missed them. Importantly, should operational parameters/limits for storms be included as mitigation? Are they specific to Falklands? There is knowledge of storm events in the region; has this knowledge been translated into mitigation?	Inshore operations will not be undertaken outwith the following weather criteria (EIS Section 12.2.5): - Mooring 25 knot wind - Suspending Cargo Transfer 30 knot wind, 2.0m significant wave height - Disconnection of Cargo Hoses (prepare for departure of both vessels from the Buoy Mooring) 35 knot wind - Vacate Buoy Mooring 40 knot wind The FPSO is designed for safe operations in all predicted weather conditions offshore, and the envelope of weather is well understood from predictive models, from measurements taken in-field and from the history of exploration drilling over the previous two decades. Certain operations will also be restricted by weather including lifting, transfer of bulk cargoes and the close approach of vessels. These will be	==

Consultee	Representation	POEPL response	Amendments/further detail
		included in the project's operational requirements and include criteria such as those listed in Appendix 12A of the OGUK Guidelines for Offshore Marine Operations and within the requirements of the Safety Case for the FPSO and Drilling Rig. Seafastening procedures will be in place on the FPSO and Drilling Rig to prevent windblown debris or movement of portable items during adverse weather.	
SMSG29	Pg 1226, 12.2.4.9.2 Oil fate predictions. The second bullet point suggesting that there is little likelihood of oil spills in Berkeley Sound reaching Cape Pembroke is clearly not true. See Figs 298, 292, 293, 294, 295, 296.	The second bullet point indicates that there is a low likelihood of oil spills in Berkeley Sound reaching the shore south of Cape Pembroke. There is a likelihood of oil reaching this shore (for the 3,000 and 50,000 tonne spill scenarios), but this likelihood is very low.	==
SMSG30	The shore line and subtidal habitats and species in the area of Cape Pembroke and the Tussac Islands are under some scenarios significant receptors of unplanned/accidental impacts that need to be addressed specifically. These areas represent unique habitats and species not seen in other nearby areas, particularly with regard to subtidal areas (e.g., Phragmatopoma virgini, reef building tube worms.)	The shoreline and terrestrial coastal habitats (including of the Tussac islands) are considered in the Coastal Habitats receptor. The Benthic Communities receptor includes habitats such as biogenic reefs. The Phragmatopoma reefs are generally >5m below low tide and given the properties of the oil (buoyant) and indeed when coupled the low probabilities and densities indicated by the modelling would mean that the impacts would be non-existent to very low.	==
SMSG31	Moreover, these areas are very important public recreation areas and have historic significance, and as such should be explicitly considered in the impact/risk assessment.	We accept the importance of such areas. This is dealt with broadly through the Human Population (tourism) receptor.	==

Consultee	Representation	POEPL response	Amendments/further detail
SMSG32	It may be that areas in Pt William were not identified as receptors in initial scoping exercises. If that was the case, then Pt William and specifically the Tussac Islands and Cape Pembroke should be included in EMMP monitoring plans. This need should be highlighted in this EIS.	The locations of representative baseline monitoring points can be discussed in the EMMP workshop and we welcome input from local experts into that process.	==
SMSG33	Table 308. The severity of oil spills on the marine flora, specifically kelp forests, in Berkeley Sound is likely to be underestimated in this assessment. As highlighted above, this EIS has not considered the full range of significance that kelp forests have on the ecology and structure of the shore and near shore. As such, the overall risk significance is likely to be underestimated. Improving our knowledge of the effects of oil spills on the regions illustrated in the inshore spill modelling should be of key priority in the EMMP.	The assessment does account for the importance (and sensitivity) of marine flora, which is assessed as being of Moderate sensitivity. Due to a low probability of oil reaching large areas of kelp forest following a 300 tonne spill, the severity of the effect of a 300 tonne spill has been assessed as Minor. Following the larger (3,000 and 50,000 tonne spill scenarios) the severity is increased to Moderate. We note preceding responses discussing the ecological properties of kelp, adhesion testing on kelp and ecotoxicity testing at different trophic levels that support the assessment in the EIS.	==
SMSG34	Given the underestimates of the risk to Pt William (Tussac Islands, Cape Pembroke), and the related potential impacts to kelp forests and other ecological aspect not considered in this by inshore modelling, a re-evaluation of related impacts should be done throughout Section 12.2.6 – Risk Assessment. Better acknowledgement of knowledge gaps	Referring to the combination of POEPL's responses to SMSG representations, it is believed the assessment of inshore oil spills is sound and backed by a proportionate level of scientific investigation and impact analysis. POEPL acknowledges the importance of coastal habitats including kelp forests and have incorporated their characteristics when determining assessment outcomes. There are elements of the assessment of oil spills with respect to coastal environment that will evolve in EMMP activities, and further mapping of sensitivities and response actions will be an important part of developing the detailed Oil Spill Contingency Plans.	==

Consultee	Representation	POEPL response	Amendments/further detail
	and how those impact on the assessment scoring should be presented.		
SMSG35	POEPL should be commended for recognising that there are likely to be interaction effects between identified impacts. Indeed, it is accepted that such interactions are difficult to assess. However, the decision to not incorporate this unknown element into the impact and risk assessment seems at odds with the "precautionary approach" adopted for assessment of impacts and risks. The precautionary approach was explicitly expressed in Sections; 1.6.1.1.3 "While a precautionary approach was taken during all the impact and risk assessments, it is important to note that the presence of data gaps was pivotal in determining the level of confidence in the assessment, as is described in the EIA Methodology (Chapter 8.0 of the EIS). "1.7.4.2 (Bullet 2)" The use of a precautionary approach during the assessment due to data gaps." According to this methodology, the interaction effects albeit difficult to quantify, should have been considered additional source of unknowns, and incorporated in a precautionary way into the impact	POEPL interpret this as being supportive of the approach to impact interactions in the EIS, and point out that reasonably foreseeable impacts, and interactions have been included in the EIS (e.g., multiple stresses in the event of a large oil spill by way of examining case studies). With respect to interactions being a new source of uncertainty: Chapter 13 reflects the role of the EMMP process in monitoring performance and taking steps to steer the environmental management of the project, to which POEPL is committed.	==

Consultee	Representation	POEPL response	Amendments/further detail
	and risk assessment matrix. In other words, the assessed impacts, risks, mitigation, and residuals should necessarily include ALL the identified unknowns, including interaction unknowns, in line with the precautionary principle.		
SMSG36	In fact, Table 324 does somewhat quantify those unknown interactions. This table identifies areas of interaction and provides an overall score of "Total number of ways receptor could be impacted" by interaction effects. For example, there are 10 ways in which receptors of Marine Mammals impact can interact. How does this affect the impact and risk assessment for Marine Mammals? The impact and risk measure is likely to be underestimated given there are 10 sources of potential interaction effects.	As per comment SMSG35, much of the assessment includes data from case studies and from experienced personnel whereby the overall impact on receptors from multiple impact interactions is included in the judgement of impacts.	==
SMSG37	Table 324 – why were inshore marine flora and fauna not included as receptors?	The row titles used are headings that flow through the EIS and include marine flora and fauna in respective compartments. We recognise that taken collectively, the coastal or inter-tidal environment is a very important and productive part of the ecosystem and the table is not intended to imply that it has been excluded, rather it is simply a function of how the receptors have been classified in order to make the EIS systematic.	==
SMSG38	Given that there are some likely underestimated impacts/risk assessments relating to kelp forests,	Please see preceding comments, POEPL believe the EMMP logically reflects the significant uncertainties and significant impacts and risks for the receptors described.	==

Consultee	Representation	POEPL response	Amendments/further detail
	plankton, impacts to habitats in Pt William, there are likely additional EMMP actions required in this table.		
SMSG39	Also identified as a significant knowledge gap are the interaction effects of impacts (Section 13). Filling this gap should also be included in the EMMP in some form.	The stated aim of the Interaction chapter is to provide an indication of the potential for impact interactions with a view to informing the EMMP process. Many of the interactions noted are already included in the assessment process, reasonably foreseeable impacts are assessed and the precautionary principle requires a plausible scientific basis for taking further precautions.	==
SMSG40	I understand that there is a planned EMMP workshop, but for now this list should include those areas identified in this EIS, including continued mapping of coastal habitats with particular reference to kelp forests, continued toxicity testing on marine eggs, larvae, and juvenile fish and invertebrates, and continued updates of all oceanographic spill model parameters and running of scenarios including continued collection of metocean data.	Mapping of coastal habitats for oil spill response will take place as an inevitable outcome of the oil spill contingency plan process and we welcome input from local experts. We have undertaken a wide suite of toxicity testing using international standardised organisms which consistently show very low levels of toxicity. Additional testing relating to squid eggs is a commitment in the EMMP (15.6.1.2). Updating the oceanographic and spill models is a commitment in the EMMP (15.6.3.4).	==
SMSG41	Proposed monitoring of Benthic Sediments (15.5.1.2) should include identification and monitoring of indicator species. It is somewhat surprising that indicator species have not been identified as yet?	Choosing indicator species will be an output from the EMMP process. The EIS discusses amphipods and squid as candidates for monitoring in respect of oil spills.	==
SMSG42	Loligo (15.5.2.6) ongoing monitoring should include toxicity tests on eggs and the close association of egg laying grounds in the vicinity of kelp forests.	Via the EMMP POEPL commit to further investigation of oil toxicity with respect to squid eggs and cooperating in investigating squid spawning areas.	==

Consultee	Representation	POEPL response	Amendments/further detail
SMSG43	I see under Oil Spills (15.6.1.2) it is suggested further research on interaction with Kelp and Egg Toxicity. Excellent. These should also be monitored consistently for chronic low-dosage effects to detect shifting baselines.	The frequency of monitoring needs to be in proportion to the risks, to take account of the scale of change triggered by the impact and the scale at which effects would be significant. It would also be important to ensure that monitoring for other economic and environmental purposes was coordinated.	==
Royal Society for the Protection of Birds (RSPB)			
RSPB1	The RSPB feels that the EIS consultation has a significant flaw due to lack of inclusion of a number of significant reports (set out in the annex below) that are key to understanding the conclusions made in the EIS, but which are not summarised in a meaningful way in that document and which have not been made publically available. Provision of supporting reports is standard practice in EIA consultation. This omission limits consultees' understanding of key issues and their ability to provide a full response to issues raised in the EIS and the licence application.	The Oil Spill Strategies (for Offshore, Inshore and Stanley Harbour) were available during the consultation period and advertised at the public meetings and in the Data Room and include the strategy for wildlife response. They were provided to parties on request during the consultation period. The EIS necessarily has to summarise and present data from a large number of technical sources in a way that is accessible to stakeholders who may have interests in specific and diverse topics. POEPL has no reservation in sharing these documents with RSPB as listed (note that the first, and last three documents in the list have been shared with Falklands Conservation) POEPL shared information for example on oil testing in relation to seabirds. Copies of these are attached to this correspondence. • Genesis. 2017. Review of Seabird Data at Sea Lion • Marengo, I. 2014b. GIS-based assessment of coastal vulnerability to oil spill of the north-east coastline of the Falkland Islands • POEPL. 2015c. Environmental assessment of potential inshore transfer sites. • Offshore Oil Spill Strategy • Inshore Oil Spill Strategy • Wildlife Response Strategy"	==
RSPB2	Baseline data We are disappointed that no effort has been made between the exploration and extraction licence	POEPL and partners have made significant investments in the collection of baseline data, offshore, inshore and onshore in support of the EIS. For example, the Sea Lion benthic survey covering 92 stations and the 12-month long PAM surveys conducted prior to the last exploration round were	==

Consultee	Representation	POEPL response	Amendments/further detail
	applications to gather more offshore baseline ecological data on birds and cetaceans. There are also significant gaps in the baseline data of receptors that may be impacted by the inshore transfer operations in Berkeley Sound, and it is hard to understand why these gaps could not have been filled in the time available. We agree that the proponent has taken a suitably precautionary approach in their risk assessments. However, these data gaps mean that there is unnecessary uncertainty regarding both the significance of impact on receptors, but also regarding the efficacy of any mitigation measures that are proposed. We believe that FIG needs to ensure these baseline gaps are filled through appropriate consent conditions prior to any operations commencing. Nevertheless, we believe that it is poor practice that this information is not available to decision makers when taking a consent decision on a major infrastructure project.	conducted at a scale that would support a development EIS, and were considerably in excess of what would be expected for exploration drilling. Given the precautionary approach adopted in the EIS we believe there is ample baseline data on which to draw robust conclusions. The EMMP takes forward further data gathering and monitoring to address remaining gaps and uncertainties. The EIS does acknowledge the data gaps and deficiencies and the methodology explicitly incorporates uncertainty. The Sea Lion Development EIA process has been guided by local experts *via* the Hydrocarbons Forum and Gap Analysis Projects. POEPL and partners have funded the Gap Analysis Project to identify and help complement project-based knowledge and reduce uncertainty, and available results have been included in the EIS, including using seabird tracking data to complement the 3-year regional seabird programme published in 2002. Satellite tracking of higher predators has been ongoing and the results have recently been amalgamated with data collected throughout the Falkland Islands. The findings of this work will be applied to further colonies in a predictive form to better determine the distribution patterns of seabirds and seals. However, the results of this latest work were not available at the time of writing. The initial results of the EU Best sei whale project are included in the ES. A number of projects to improve the environmental baseline have been ongoing concurrently with the writing of the ES such as Falklands Conservation's sei whale project, and we have striven to include such data up to the last drafting deadlines. We note the FIG EIS Guidance 3.13: "the applicant should not be accountable for data gaps that could not reasonably have been filled, but more for the way in which they address the gaps in the RA. Therefore, the presence of justifiable data gaps does not make an EIS unfit-for-purpose, as long as these are acknowledged and explained. When carrying out the risk assessment data gaps can be taken into account." And 3.18 "where there are data gaps a risk may be increased to reflect the higher degree of uncertainty (and work on a worst-case scenario/precautionary approach)."	

Consultee	Representation	POEPL response	Amendments/further detail
RSPB3	Alternatives for inshore transfer of oil We continue to be concerned with risks associated with inshore transfer of oil and believe its avoidance would be desirable. With regards to the alternative of offshore transfer, we note the issues with the safety case, but also that the Proponent will undertake trials to prove its viability or otherwise once vessels are in the water. Having not been able to review the inshore transfer location environmental assessment comparison report, we are obliged to take on face value that Berkeley Sound is the least damaging option. Due to the relative risks to the environment posed by inshore transfer we encourage FIG to ensure that any eventual consent is conditioned to ensure this work reports and a decision taken as soon as possible after operations commence, ideally with a fixed timetable.	POEPL recognises the importance of this issue to the environmental risks and performance of the project and also to its safety and commercial aspects and has done considerable work to understand the issues correctly and adopt the optimal approach. The choice of inshore transfer as the base case and the choice of Berkeley Sound as the optimal site is described over eight pages at Section 4.3.2. A more detailed justification for the choice of Berkeley Sound is referenced in this section - POEPL report "Environmental assessment of potential inshore transfer sites". This report is available for review. A summary of the decision process around Inshore Transfer versus Direct Offloading is contained in 'Additional Information'."	==
RSPB4	Bird-strike The EIS concludes that bird strike has a moderate residual significance risk to seabirds. In a worst-case this could have significant impacts on endangered seabird populations. We are concerned that there is little detail presented or apparent	We commit to applying OSPAR Agreement 2015-08 on minimising risks to birds from artificial light, which involves examining available techniques and balancing safety and operational requirements. Inevitably the detail of lighting design, fittings, shielding, lamp types, lighting philosophy for safe operations etc. must take place post-EIS approval when detailed design and rig selection is being undertaken. We have committed to investigating non-pilot flares but we note that they must be extremely reliable to be	==

Consultee	Representation	POEPL response	Amendments/further detail
	commitment to identify mitigation measures to reduce this potential, which are not dependent on a reaction to in-situ monitoring once vessels are in place and impacts already occurring. Again, as a condition of consent the Proponent should be required to outline in detail measures they will take to reduce artificial light pollution on its operating vessels, platform and FPSO. This should include a requirement to investigate and report in a timely way (before production) on the potential for use of non-pilot flares and green spectrum lighting. This information should form part of a precautionary state-of-the-art bird strike mitigation plan agreed before project implementation. This is particularly important as adaptive management and retrofitting of vessels once in the field is likely to be difficult, expensive and potentially impractical.	accepted as Safety Critical pieces of equipment and this includes a track record of successful deployment in similar operations in offshore settings. The EIS notes that a Bird Strike Management Plan is required prior to operations commencing and this is also included in the EMMP, and a BSMP was in place for previous exploration well operations.	
RSPB5	Oil spill response We note that the offshore oil spill scenarios in the EIS factor in oil spill response into their final risk significance values, but that the document then states that due to the weather conditions in the North Falklands Basin, oil spill response is unlikely to be a feasible mitigation	The EIS recognises that 'at sea recovery may not always be feasible in the Falkland Islands due to prevailing sea conditions'. The prevention of releases is always the primary risk reduction measure. It has been demonstrated that Sea Lion crude oil is solid at sea temperatures. Laboratory tests using feathers of nine species of seabird from the Falkland Islands showed that at low concentrations no oil was adsorbed by the feathers, and no structural damage was observed. At high concentrations, which would be limited in spatial extent, feathers became stained, and a	==

Consultee	Representation	POEPL response	Amendments/further detail
	option. FIG decision makers need to be cognisant that, although unlikely, should a major spill event occur offshore, there will be very little that can be done whilst impacts occur to globally important seabird populations for which they are responsible.	small amount of oil was adsorbed by the feathers of two of the species tested. The sensitivity of the local bird populations including their global importance has been taken into account in the assessment.	
RSPB6	Inshore there is little information in the EIS to show how the proposed oil spill response mitigation has taken into account the most sensitive colonies and habitats in Berkeley Sound –such as the large colony of near-threatened Sooty Shearwaters– or detail as to why the mitigation strategy chosen was picked over those which would result in better response outcomes. No attempt has been made to try to quantify the potential extent of impact on individual protected areas and their interest features within the Sound. As above, FIG decision makers should be aware that a major oil spill event in Berkeley sound, even with oil spill response, will have adverse impacts on nationally important seabird and cetacean populations for which they are responsible.	A large number of different response options and different equipment types were analysed in arriving at the preferred strategy, described in 12.2.7.1.1 in the EIS and given in more detail in the Inshore Oil Spill Strategy where a sensitivity analysis on the number of spill response units was also undertaken. The oil spill response mitigation utilised expertise from multiple international spill response experts (Morlich Consulting, SpillConsult, Franklin Marine, Braemar, Aiuka) and involved respected ecological experts with specific experience of the Falkland Islands in undertaking the EIS. An unprecedented amount of analysis has been undertaken on the crude oil to understand its behaviour and risks in the local environment including testing on sooty shearwater feathers amongst others. The spill response includes equipment specifically chosen for the crude oil type and includes a system of shoreline booms to limit migration of oil along coastlines towards the more sensitive areas. It is recognised that a major oil spill event in Berkeley Sound could have significant impacts on seabirds and cetaceans at certain times of year and the risks are assessed in the EIS according to a transparent assessment protocol (12.2.6.1.3). Such risks are inherent with the use of inshore waters for commercial activity and POEPL's proposals include numerous risk management measures such as vessel traffic management, the use of a mooring buoy, a local pilot and tug escorts amongst others.	==
RSPB7	Agreed Inshore and Offshore Oil Spill Response Plans and a Wildlife	The legislative regime in the Falkland Islands is such that operations could not commence without these approved plans being in place and therefore POEPL believes a specific condition would not be required.	==

Consultee	Representation	POEPL response	Amendments/further detail
	Response Plan should be a condition of consent.		
RSPB8	Environmental Monitoring and Management Plan Due to the uncertainties surrounding identified impacts to receptors in the EIS, it is vital that the EMMP is a robust, long term and iterative process that builds in adaptive management mechanisms to amend project activities and mitigation measures as needed. As such, we have a number of issues (set out in the Annex to this letter) which we believe the EMMP must address, and which are not adequately covered in the EIS. In addition, due to the vital importance of the EMMP in monitoring and addressing project impacts we believe that FIG need to carefully condition the set up, and implementation of the EMMP so that they retain a close regulatory and enforcement role, as would come into effect under the draft Environmental Case legislation.	POEPL agrees that development of an EMMP is an important step post-EIS approval. POEPL agrees with RSPB's points that the representation on the EMMP should include experts from the Proponent, FIG and relevant sector stakeholders (e.g.: fisheries/nature conservation). POEPL agrees that reviews should take place at intervals of no more than 5 years and agree it would make more sense to have short review periods at the start of operations, gradually increasing as time progresses, and so as certainty over impacts increases e.g., 1, 3, 6, 10, 15 years. POEPL supports FIG's recent consultation on the implementation of an Environmental Case model for future regulation subject to further discussion on comments submitted.	==
RSPB9	Offsetting The EIS sets out that all residual moderate impacts will be dealt with through 'offsetting' contributions to the Environment Fund. Although we understand that it is difficult for the Proponent to undertake direct or	Where POEPL has identified potentially significant impacts, POEPL has responded with alternative proposals during project development and/or we have applied mitigation to control the impacts and risks. FIG paper 124-16 is around developing a policy on further addressing significant impacts *via* offsetting, giving applicants a choice between managing their own projects that are considered offsetting or contributing to an Environment Fund managed by FIG. POEPL has chosen to adopt the Environment Fund	==

Consultee	Representation	POEPL response	Amendments/further detail
	indirect offsetting themselves, it is very important that these contributions are ring-fenced for conservation projects that benefit the conservation status of species and habitats that are impacted by the project, rather than being part of any wider pot of money. In particular, projects to enhance baseline data provision are not offsetting and should not be considered for funding from this source.	approach and is reliant on FIG to deliver the offsetting. The application of this principle has involved considerable discussion and an agreement was reached on a meaningful level of contribution which involved reference to other similar projects and activities around the world within an Environment Fund Briefing Note supplied to FIG. This approach is intended to deliver both offsetting and environmental legacy *via* the environment fund option which was expressed as FIG's policy preference in the ExCo paper 124-16.	
RSPB10	We note that the Proponent is including offshore and inshore oil spill residual impacts in its offsetting contributions to the Environment Fund. In reality, it is not possible to offset for impacts that would only occur in the event of an accident, and this would in no way absolve the Proponent of their remediation obligations in such an instance. We are therefore taking it that this is part of a 'net gain' contribution by the Proponent to the environment of the Falklands, and as such it should be considered a separate contribution.	POEPL agrees that offsetting unplanned events is problematic and the most likely outcome predicted for inshore transfer is zero spills over field life. In the event of a spill, there are mechanisms for response, compensation and remediation that are backed by insurances and which will take place irrespective of offsetting. POEPL believe that offsetting is not an applicable mechanism for unplanned events that may not occur and this interpretation is intended in the EIS text "It has not been possible to develop a practicable direct offset due to the uncertain impact, particularly as it may not occur during the life of field".	==
RSPB11	Decommissioning We note the commitment in the EIS to decommission the project to UK standards. Whilst acknowledging that at this stage it is not practical to have a detailed decommissioning plan, we	The EIS notes that the concept allows for the simplest means of decommissioning. POEPL would carry out a debris survey before relinquishing the licence resulting in a clearance certificate. It is a standard clause in petroleum production licences that operators must have financial provision to cover decommissioning costs and it is normal for them to demonstrate this periodically to the regulator, and we expect this to	==

Consultee	Representation	POEPL response	Amendments/further detail
	believe this needs to be an integral part of the project and a condition of the consent. In addition, we believe there should be a requirement to ensure that funds will always be available for the full decommissioning of the project, especially in the event that the operator went bust, or the operation was sold to a different company. Not doing so would risk unacceptable liabilities to Falklands and potentially UK taxpayers.	be covered in the Field Development Plan approval process. This obligation would transfer to any new owner with the licence.	
RSPB12	Remediation Liabilities The Deep Water Horizon blowout illustrated the potential enormous scale of environmental liabilities in the event of a catastrophic event. FIG and the UK government therefore need to have certainty that the Proponent has adequate resources and insurance to fully cover a worst-case scenario event. This information should be publicly available for reasons of clear public interest. Not to do so would risk unacceptable consequences for the globally important environment of the Falklands, Falkland Islanders and potentially UK taxpayers.	Provision for financial liabilities relating to oil spills is covered separately to the EIS and is linked to subsequent approvals such that EIS conditions are not necessary. Substantial sums are provided for in insurances and compensation schemes that fully cover the costs of worst-case releases, however unlikely. Information on the typical levels of financial provision is provided under 'Additional Information'.	==
RSPB13	Legislation For the reasons set out above and in the annex below, the RSPB does not believe that the EIS as it currently	POEPL believe the EIS is compliant and contains sufficient information for a determination. POEPL also note that many matters raised by RSPB are	==

Consultee	Representation	POEPL response	Amendments/further detail
	stands allows FIG decision makers to make a fully informed decision on licence application. However, if a decision is taken to consent the project we strongly recommend that robust conditions address these issues prior to operations commencing.	managed within the EMMP and subsequent approvals prior to operations commencing.	
RSPB14	Documents The following reports form the basis of important conclusions outlined in the EIS, which were not available to consultees, and which detail specific issues relating to the ecological impacts to birds, cetaceans and coastal habitats which are important in reviewing the EIS and the adequacy of its assessments and conclusions: · Genesis. 2017. Review of Seabird Data at Sea Lion · Marengo, I. 2014b. GIS-based assessment of coastal vulnerability to oil spill of the north-east coastline of the Falkland Islands · POEPL. 2015c. Environmental assessment of potential inshore transfer sites. · Offshore Oil Spill Strategy · Inshore Oil Spill Strategy · Wildlife Response Strategy"	See response to RSPB1.	
RSPB15	Env Basline We have not been able to review the Genesis report to be able to review	It is acknowledged in the EIS that the age of the Seabirds-at-Sea dataset, and inherent limitations of the survey method, mean that there are some questions regarding how representative the data are of present day	==

Consultee	Representation	POEPL response	Amendments/further detail
	their assessment and arguments. The coverage of the data (although in a much smaller time series) may or may not be equivalent to that used in frontier areas in the UK. This does not imply that the data used in these new UK fields is adequate and the environment offshore in the UK is not as environmentally sensitive as that of the North Falklands Basin (NFB), which we feel should imply a need for a higher level of effort.	populations. See Section 7.4.5.2.1.1. An independent review of the data (Genesis, 2017) concluded that while there were gaps, the seabird data was adequate for EIS purposes and equivalent to frontier areas of the UK with oil and gas activity where the UK Government and its nature conservation agencies permit development in light of this data. Given these uncertainties, a precautionary approach has been applied to the assessment of risks to seabirds e.g., in the oil spill assessments they have been considered as high sensitivity and impacts assessed as moderate, serious or major depending on the size of the spill. It is also acknowledged that a combination of satellite tracking and at-sea observations is likely to provide the best overview of seabird distribution within the waters of the Falkland Islands. The Sea Lion Development EIA process has been guided by local experts *via* the Hydrocarbons Forum and Gap Analysis Projects. POEPL and partners have funded the Gap Analysis Project to identify and help complement project-based knowledge and reduce uncertainty, and available results have been included in the EIS, including using seabird tracking data to complement the 3-year regional seabird programme published in 2002. Satellite tracking of higher predators has been ongoing and the results have recently been amalgamated with data collected throughout the Falkland Islands.	
RSPB16	Env Baseline The fact that much of the NFB east of the drill site has no SAST data in sensitive months (see Fig's 95-98, pp 380-383) clearly indicates a significant data gap, particularly when considering impacts from spill events. There is little indication that the available GAP seabird tracking data has filled this. Indeed, the report states (p.333) that penguin tracking data has not yet been	See response to RSPB03.	==

Consultee	Representation	POEPL response	Amendments/further detail
	compiled and analysed to enable its use.		
RSPB17	Env Baseline The EIS suggests that the SAST data is still relevant, as available Rockhopper penguin tracking summer tracking data corresponds well with the surveys of 2000. Even a brief glance at Fig.77 shows this is not the case, and that most penguin tracks are either in squares where SAST recorded no birds, or in squares which were not covered by SAST at all.	See response to RSPB03.	SAST surveys were not the sole source of seabird distribution data. The assessment does not rely solely on any one source of data. Although the recent GAP tracking data was not available at the time of writing, tracking data collected prior to writing was.
RSPB18	Spill Impacts The RSPB acknowledges the precautionary nature of the oil spill assessments made in the EIS, and that in relation to bird strike risk, baseline data without vessels in the water may not provide a reasonable basis of assessment (due to birds being attracted to the vessels). However, this does not overcome the fact that the Proponent has not undertaken any systematic, repeatable offshore seabird surveys in the offshore zone of influence, leading to their risk significance assessments for oil pollution events being highly uncertain. We do not believe this is a reasonable outcome for the EIS of a large	See response to RSPB15.	==

Consultee	Representation	POEPL response	Amendments/further detail
	extractive project in a globally sensitive environment.		
RSPB19	Env Baseline Volunteer lagoon is a key seabird site in the vicinity of Berkeley Sound, and yet no baseline surveys were undertaken to ascertain population numbers of seabirds, their significance nationally and their temporal use of the site.	The most recent (winter) coastal seabird survey has covered this area and it will be repeated in future surveys. Volunteer Lagoon is not considered especially significant for coastal seabirds. There is a very low probability of oil predicted to enter the narrow mouth of the lagoon and the booming plans in the Oil Spill Strategy include a booming location across the mouth of the lagoon to prevent oil ingress.	==
ESPB030	Env Baseline Excluding penguin populations, no attempt has been made to quantify the significance of seabird populations at Berkeley Sound colonies in relation to national or biogeographic scales, making it difficult to assess risk significance for these populations.	POEPL do not believe that quantifying the populations would add materially to the impact assessment given uncertainties in the impacts, and the assessment of populations of conservation importance is a strategic matter that is the subject of historic and ongoing studies and research. The impact assessment in the EIS accords a high sensitivity to seabirds in Berkeley Sound recognising large and important populations in the assessment with moderate, serious and major impacts on seabirds recorded for different sizes of oil spills inshore.	==
RSPB031	Env Baseline We are concerned that significant effort has not been put in to survey the numbers and behaviour of the sooty shearwater population in and around the sound, as these are a potential key species which could be affected by an oil spill event and key feature of Kidney and Cochon island Important Bird Area (IBA).	The impact assessment in the EIS accords a high sensitivity to sooty shearwater recognising a large and important population in the assessment with moderate, serious and major impacts on seabirds recorded for different sizes of oil spills inshore. Emerging data on population estimates e.g., on Kidney Island and Bird Island by Ewan Wakefield *et al.,* continues to contribute knowledge to this area. It is inevitable that new data will emerge and this will be incorporated in the EMMP and is noted in Section 15.5.2.1 of the EIS.	==
RSPB032	Spill Impacts The baseline data for birds in and around Berkeley Sound is patchy	See response to RSPB15.	==

Consultee	Representation	POEPL response	Amendments/further detail
	and excludes important data. The RSPB believes that these holes in the baseline need to be completed, and risk assessments re-appraised in advance of any operations occurring in the Sound.		
RSPB033	Env Baseline There is no explanation of why the oil vulnerability was not calculated using the newer SOSI method, rather than OVI.	The implementation of SOSI is a matter of national policy and has not been attempted in the Falkland Islands, it requires careful application as both methods introduce different levels of bias e.g., towards those species whose carcasses are more readily found on shorelines. As and when there is a policy change to the use of SOSI in the Falkland Islands, we would be happy to review the findings *via* the EMMP forum.	The range of data required to apply the SOSI method is not available for the Falklands. Any update on OVI methodology would rely on the same data and this was considered to be of limited value.
RSPB034	Env Baseline As above these figures illustrate the lack of baseline data, and so OVI values for much of the area east of the project area that would be impacted by spill events.	Gaps in the survey data are an intrinsic issue and the data is interpreted in the same way as equivalent datasets in the UK. The GAP higher predator work was initiated by the Offshore Hydrocarbons Environment Forum including POEPL and partners *via* FIPLA specifically to address issues such as this and to begin to fill the gaps, and the tracking studies have contributed to improving the confidence in the sum of the datasets that have been used in this assessment. The project will generate monitoring data *via* seabird and marine mammal observers that will be used to review the findings and reduce the uncertainties that have been acknowledged and included in the assessment.	==
RSPB035	Env Baseline The project area, which has implications regarding the certainty of assessment for risk significance from spill events for marine mammals.	The baseline data for marine mammals incorporates a number of data sources, in particular the 12-month JASCO acoustic survey data (Hipsey*et al.,* (2013)). Other data sources are used to corroborate the findings and understand the uncertainties which are acknowledged.	==
RSPB036	Env Baseline No specific field surveys were undertaken by the Proponent to assess marine mammal populations in Berkeley Sound and surrounding	The EIS has used the best available data at the time of writing in a body of water that is relatively well understood locally and has been used for decades for commercial activity. Receptors in Berkeley Sound such as marine mammals and seabirds have been accorded 'high' sensitivity in the assessment process. There is emerging data through research and	

Consultee	Representation	POEPL response	Amendments/further detail
	area, despite the fact that the existing patchy data shows it holds significant seal and cetacean populations. In our opinion this is a significant failing in the EIS, and makes it very difficult to assess the significance of marine mammal populations present, the risk significance of impacts affecting them, and the efficacy of any mitigation measures proposed to address these issues (e.g.: inshore oil spill response, disturbance and collision).	monitoring being undertaken by Falklands Conservation on sei whales and SAERI on dolphins & other cetaceans. As new data emerges, the EMMP process is designed to allow that to be brought to the table and to understand if management practices need to be adapted and will work in conjunction with the 5-year review process for the EIS.	
RSPB037	Env Baseline No indication of the relative significance of sealion colonies and haul out populations within a national or biogeographic context, whereas this information is provided for fur seals.	Fur seal census data is currently being worked up by SAERI. As new data emerges, the EMMP process is designed to allow that to be brought to the table and to understand if management practices need to be adapted and will work in conjunction with the 5-year review process for the EIS.	An indication of the proportion of the breeding population within Berkeley Sound has been added to the text. It is harder to determine the proportion of animals that use the area as a haul-out but several haul-out sites are highlighted in the text.
RSPB038	Env Baseline The RSPB does not think that the baseline information provided in the EIS, particularly inshore, is fit for purpose. As such, if consent were granted we strongly recommend that this information is required before operations commence in the Sound, and that risk assessments and mitigation strategies are re-appraised at this time.	The uncertainties in data have been acknowledged and communicated into the EMMP. Delivery of the EMM Plan will continue to strengthen the conclusions and there is no doubt that the deliverables of the oil spill contingency plans, the bird strike management plan and other documents will incorporate the latest and best available evidence.	==

Consultee	Representation	POEPL response	Amendments/further detail
RSPB039	Env Baseline Having not been able to review the Marengo report, we are not able to comment on this assessment and its conclusions. There is no explanation in the EIS of how its results have been taken into account in the Inshore Oil Spill Strategy.	The report on coastline sensitivity index assessment is attached. Coastline type has been incorporated in the oil spill modelling by mapping the ESI coastline designations into different coastline properties which is a function available in the OSCAR model, which reflects in the amount of oil that is predicted to adhere to coastlines, and the rate at which it is re-mobilised due to waves and currents.	==
RSPB30	Scoping We have already made our views clear on the scoping process of the EIS (our letter 17/10/17). In the explanation of the internal ENVIID scoping process, there is no mention of how the external consultation influenced the eventual scope of the assessment.	The scope of consultations and their outputs are described in some detail in Chapter 6 of the EIS.	==
RSPB31	Artificial Light We are concerned that only limited mitigation measures to reduce light pollution, and so the potential for seabird attraction and wrecks, have been outlined in the EIS, and that investigation of pilot-free flares and green deck lighting has been put back to post-sanction.	The main mitigation measure is to follow the guidelines of the OSPAR Convention whose purpose is to minimise pollution of the northeast Atlantic and North Sea including light pollution. This in turn requires a series of options to be investigated and balanced with safety and operational imperatives. This investigation will take place during detailed design and the outcomes cannot yet be determined, although a number of possibilities have been noted.	==
RSPB32	Artificial Light Due to the uncertainty surrounding bird strike both offshore and inshore, particularly as seabird usage in the areas surrounding project vessels may be influenced by attraction, we	POEPL recognise the uncertainty and agree that monitoring will be an important part of the mitigation and is included in the EMMP plans.	==

Consultee	Representation	POEPL response	Amendments/further detail
	agree that further comprehensive monitoring is undertaken, as part of a Bird Strike Management Plan and integrated into the EMMP.		
RSPB33	Artificial Light The RSPB strongly recommends that an agreed Bird Strike Management plan is a condition of consent, and that all reasonable mitigation measures RE: the design of project vessels are implemented before operations commence, as retrofitting vessels in the field may be prohibitively expensive or impractical. Saying this, bird strike monitoring should be an integrated part of the EMMP as outlined below, and an adaptive management approach adopted such that if significant impacts occur, further mitigation measures are put in place address them.	A bird strike management plan is a commitment in the EMMP and was previously prepared for the exploration wells campaign. POEPL believe that a condition is not necessary and would not change our commitment to this matter. The EMMP is a vehicle that will enable active management of issues in response to the data being collected. We look forward to developing the BSMP nearer to operations commencing and following discussion with our respected colleagues at the EMMP workshop.	==
RSPB34	Airborne Noise Although we acknowledge that with the mitigation measures outlined in the EIS, significant impacts are unlikely to occur to sensitive species populations, we do however feel that monitoring of the implementation/enforcement of FILFH protocols is included in the EMMP, to ensure that this is the case during operations.	During development of the EIS, exploration campaign helicopter provider Bristows were contacted regarding their observance of the low flying handbook. In response they confirmed the strict induction process that takes place, they provided POEPL with the maps used as the basis for avoiding areas sensitive for wildlife and they also noted that all flight paths are recorded and retained on their GIS system for later enquiry. In examining the flights for POEPL during the Exploration Wells campaign, the vast majority of logs are at 4000' or 5000', well above a height that should cause an issue for wildlife. A small number of points were identified that were lower than 3000' over the areas with higher potential for bird strikes, but these appeared to be either low-level SAR flights or that the altitude had	==

Consultee	Representation	POEPL response	Amendments/further detail
		to be reduced for operational reasons and hence remained in line with the local policy. An example of the GIS system screen is shown in 'Additional Information'. The level of flight data automatically recorded allows compliance to be audited, and periodic audits of compliance may be a valid way to monitor this. Currently the issue is not included in the EMMP following the criteria applied in relation to significance, sensitivity and uncertainty.	
RSPB35	Mammal collision The EMMP needs to include collision monitoring and monitoring of the implementation of mitigation measures (e.g.: ship speeds).	EIS section 15.6.3.2 includes marine mammal collisions in the scope of the EMMP.	==
RSPB36	Documents We have not had the opportunity to review the offshore oil spill strategy which should have been appended to the EIS as a key mitigation strategy.	See response to RSPB1.	==
RSPB37	Spill Prevention/Response Although it is discussed, no summary is given in the EIS of FPSO collision risk or iceberg collision risk.	Iceberg collision is not plausible due to the design of the facilities enabling disconnect and sail away and the approach speed of icebergs. 15.6.3.3 includes a commitment to review shipping patterns for collision risk and this will be used to update safety risk models that are routinely produced and which would be made available closer to operations commencing.	==
RSPB38	Spill Prevention/Response It is unclear from the EIS where anchor-handling vessels offload captured oil – is this to other vessels in the vicinity, or to onshore facilities?	12.1.4.4.5 states "The AHV unit would store 200 tonnes of oil and take 48 hours to offload, as it is assumed that no offshore storage would be available." This is intended to indicate that the AHV would return to Stanley where it would offload to an expanding oil bladder designed for such purposes which would be stored at the TDF/supply base. As part of its international oil spill response agreements, POEPL will also be able to mobilise vessels to the field to enable offload of oil from the anchor handling vessels in a matter of days if there is a major incident.	==

Consultee	Representation	POEPL response	Amendments/further detail
RSPB39	Spill Prevention/Response Although the scenario assessments for FPSO and well blow-out included offshore oil spill response as a mitigation measure, reducing residual impacts, this concluding section states that offshore oil spill response is unlikely to be a viable option. It would therefore have been clearer not to include it in the individual scenario assessments.	The text is intended to communicate that offshore recovery has not indeed been included in the scenario assessment rankings for a prolonged blowout at the maximum reservoir rates. It would of course still be attempted and it does make a difference in the outcomes, and in calmer weather, recovery might be appreciable, but such periods are not 'visible' in the stochastic outputs for such a very prolonged blowout. The efficiency for smaller incidents will be higher and it is a valuable tool in such situations.	==
RSPB40	Spill Prevention/Response Although in the baseline section above, the seabird data is deemed adequate, this section acknowledges that species distribution is a data gap. In our opinion, this gap should have been filled within this EIS process, and it is not an appropriate response to leave it to the GAP project at some point in the future.	Such gaps are intrinsic to offshore seabird data worldwide and the data is considered adequate for the purposes of the assessment. The GAP project was deliberately initiated and supported by POEPL and partners and has been active since 2014 in helping to improve this dataset. In that time it has successfully tracked over 200 animals and the available outputs have been incorporated in the EIS.	==
RSPB41	Spill Prevention/Response We have not had the opportunity to review the inshore oil spill strategy which should have been appended to the EIS as a key mitigation strategy.	See response to RSPB1.	==
RSPB42	Spill Prevention/Response Without explanation, this table and associated section is not legible to a non-specialist audience.	We agree that additional notes would assist interpretation, but it is inevitably a difficult topic. The rest of the text in 12.2.4.3.2 does explain the figures in more simplified language.	Table amended to aid interpretation

Consultee	Representation	POEPL response	Amendments/further detail
RSPB43	Spill Prevention/Response This talks about recovered oil storage capacity, but as offshore, it is unclear what this is referring too.	Section 12.2.(etc.) is for inshore spills, not offshore, and recovered oil storage is explained in the earlier sections.	==
RSPB44	Spill Prevention/Response It is unclear why response option 5 has been chosen over other options that would achieve better response results (e.g.: options 2,12 and 13).	The associated text states "The comparative assessment showed that three response vessels (e.g., DOSRV, MRSV and ISV after releasing CTT static towline - Option 5 in Figure 299) are able to start recovering oil within 15-30 minutes and in doing so will reduce the amount of oil reaching the shore substantially more than when using two vessels (Option 8). Thereafter, the extent of the gain from different combinations declines." This reflects that supplying more equipment, especially additional vessels, dramatically increases the cost without increasing the benefit in proportion. The test of disproportionate cost is a key test in the ALARP process. This is expanded in more detail in the Inshore Oil Spill Strategy. Although it is not explicit, the chosen set of resources illustrated in Table 313 corresponds to Option 5 plus additional storage plus shoreline booming locations, i.e., performs better than Option 5 alone, whereas Figure 299 is shown simply to illustrate one stage in the process of identifying and comparing and options.	==
RSPB45	Spill Prevention/Response From the information presented in the EIS, it is unclear how the inshore oil spill mitigation has taken into account the coastal sensitivities, and key seabird and marine mammal sites in Berkeley Sound and its surrounding area. Oil spill marker species monitoring should be included in the EMMP, as should spill modelling before each inshore transfer operation (to also take into account ecological sensitivities dependent on time of year).	The inshore spills assessment chapter runs to 88 pages and includes a methodical description of the sensitivities, the potential impacts without mitigation, the preventative measures that were identified and the development of oil spill response plans that mitigate the impacts. It draws on the baseline and sensitivity information in Chapter 7. We believe this is an appropriate level of commentary for a public EIS and various other documents are referred to that are available for review for stakeholders with a more detailed interest. Section 12.2.10.3 identifies the need to identify marker species for oil pollution and this is repeated in EMMP Section 15.5.2.3 and 15.5.2.4.	==

Consultee	Representation	POEPL response	Amendments/further detail
RSPB46	EMMP A clear distinction needs to be made between inadequacies in the spatial and temporal coverage of baseline data in the EIS, which needs to be closely conditioned and completed before operations commence, and operational monitoring and management of impacts, which should be managed by the EMMP process.	POEPL believe that the level of baseline data in the EIS is adequate and the EIS is compliant in that respect. There is a clear process for identifying matters to be included in the EMMP by virtue of their significance, uncertainty and sensitivity. In this context, we do not believe additional conditions are necessary.	==
RSPB47	EMMP The RSPB recommends that the EMMP steering group includes relevant experts/representative from the Proponent, FIG and relevant sector stakeholders (e.g.: fisheries/nature conservation).	See Response to RSPB8.	==
RSPB48	EMMP Instead of 5-year review periods, it would make more sense to have short review periods at the start of operations, gradually increasing as time progresses, and so as certainty over impacts increases. This might look something like 1, 3, 6, 10, 15 years etc.	See response to RSPB8.	==
RSPB49	EMMP Although the EIS provides a bare-bones outline of the EMMP scope, this needs to be discussed and agreed by a representative steering	POEPL agrees that an EMMP workshop should be held as soon as possible after EIS approval including respected colleagues in nature conservation along with other parties and membership of the EMMP steering group is the first bullet point of Section 15.2 regarding the EMMP.	==

Consultee	Representation	POEPL response	Amendments/further detail
	committee once sanction has been given.		
Falklands Conservation (FC)			
FC1	Legislation Legislation and policy: A good EIA will consider its compliance with legislation and policy and identify where its actions can contribute to policy objectives – the current EIS needs to consistently address legal and policy compliance and demonstrate a clear aspiration to meeting good practice policy objectives such as the 'net gain' principle.	POEPL understand the issues raised and the EIS addresses relevant legislation and policy which is summarised in each assessment chapter. We question whether 'net gain' is a stated objective of Falkland Islands policy for development in general, or for environment or for hydrocarbons or how such gain would be measured within the large economic benefits of an oil development. The Minerals Ordinance is clear in the obligations to manage significant adverse impacts and we believe these have been addressed within the EIS.	==
FC2	Env Baseline Data: The EIS acknowledges wide ranging data deficiencies yet disappointingly little relevant survey work has been conducted and included in the EIS for a development of this scale. The survey information provided needs to be more robust (e.g., more survey visits or more recent) and/or improve its coverage to include missing key locations or species. Key data that are available, such as for non-statutory designated sites for nature conservation, are not used appropriately/consistently, or at all, and need to be incorporated.	POEPL and partners have made significant investments in the collection of baseline data, offshore, inshore and onshore in support of the EIS. For example, the Sea Lion benthic survey covering 92 stations and the 12-month long PAM surveys conducted prior to the last exploration round were conducted at a scale that would support a development EIS, and were considerably in excess of what would be expected for exploration drilling. Given the precautionary approach adopted in the EIS we believe there is ample baseline data on which to draw robust conclusions and be able approve the EIS. The EMMP takes forward further data gathering and monitoring to address remaining gaps and uncertainties. The EIS does acknowledge the data gaps and deficiencies and the methodology explicitly incorporates uncertainty. POEPL and partners have also funded the Gap Analysis Project in parallel to identify and help complement project-based knowledge and reduce uncertainty and available results have been included in the EIS, including using seabird tracking data to complement the 3-year regional seabird programme published in 2001. Satellite tracking of higher predators has been ongoing and has been applied to further wildlife colonies in a predictive form. However, the results of this	==

Consultee	Representation	POEPL response	Amendments/further detail
		latest work were not available at the time of writing. The initial results of the EU Best sei whale project are included in the ES. The designation of conservation sites in the Falklands and their conservation objectives and management is not as developed as some other parts of the world. The ES has aimed to assess the sensitivities consistently, which in many cases is believed to result in a precautionary assessment. We note FIG EIS Guidance 3.13: "the applicant should not be accountable for data gaps that could not reasonably have been filled, but more for the way in which they address the gaps in the RA. Therefore, the presence of justifiable data gaps does not make an EIS unfit-for-purpose, as long as these are acknowledged and explained. When carrying out the risk assessment data gaps can be taken into account." And 3.18 "where there are data gaps a risk may be increased to reflect the higher degree of uncertainty (and work on a worst-case scenario/precautionary approach)."	
FC3	Liabilities Oil Spill response: The EIS identifies that oil spill responses would not be possible under worst-case weather conditions, and combined with insufficient details on financial arrangements for spill response and remediation programmes (which may be over multiple years), further conditions need to be applied to provide confidence.	It is far more important to prevent releases than to attempt to control oil once it is in the environment, particularly offshore where weather conditions limit recovery and given that dispersant is not effective. Spills are prevented offshore by a variety of means including the application of Safety and Environmentally Critical Elements processes which were strengthened after the Deepwater Horizon incident *via* a European Directive and a significant revision of the Safety Case Regulations. These require systems that control Major Environmental Incidents to be managed in a formal way that brings those risks to a tolerable (low) level, by ensuring that systems are in place to manage critical equipment (design, reliability and maintenance), operational procedures and personnel competence, brought together as the management of Safety and Environmentally Critical Elements. Provision for financial liabilities relating to oil spills is covered separately to the EIS and is linked to subsequent approvals such that EIS conditions are not necessary. Substantial sums are provided for in insurances and compensation schemes that fully cover the costs of worst-case releases, however unlikely. Information on the typical levels of financial provision is provided under 'Additional Information'.	==

Consultee	Representation	POEPL response	Amendments/further detail
FC4	Offsetting Offsetting: There has been little apparent effort to consider offsetting options for biodiversity and carbon. Payment for offsetting is not considered good practice. Consequently, the EIS needs to provide stronger justification for payment as an option and a monetary value to assess its suitability, along with a guaranteed mechanism to ensure any financial contribution is used appropriately. The scale of the figure suggested in the recent ExCo paper (124/16) is very low (c£3m over 17 years).	Where potentially significant impacts have been identified, POEPL has responded with alternative proposals during project development and/or have applied mitigation to control the impacts and risks. FIG requires POEPL to include offsetting within the EIS for impacts that are significant and paper 124-16 is around developing a policy on this topic, giving applicants a choice between managing their own projects that are considered offsetting or contributing to an Environment Fund managed by FIG. POEPL has chosen to adopt the Environment Fund approach and is reliant on FIG to deliver the offsetting. The application of this principle has involved considerable discussion and an agreement was reached on a meaningful level of contribution which involved reference to other similar projects and activities around the world within an Environment Fund Briefing Note supplied to FIG. This approach is intended to deliver both offsetting and environmental legacy *via* the environment fund approach which was expressed as FIG's policy preference in the ExCo paper 124-16.	==
FC5	EMMP Environmental Monitor and Management Plan (EMMP): The EMMP is poorly aligned with its intended purpose and inappropriate in scope. It is heavily weighted towards monitoring and provides few management solutions. The EMMP should not deliver baseline data which should have been included within the EIS, but focus on monitoring the less certain risks/mitigation and identify real action that can be undertaken should those risks worsen or mitigation fail.	The purpose of the EMMP is to define the management actions and resources required, respond to the priority data gaps/areas of uncertainty identified in the assessment, and importantly to assess and monitor the effectiveness of the mitigation measures during all stages of the proposed operation, and based on this monitoring to help underpin an adaptive approach to the management of the operation to prevent or reduce risks to the environment.	==

Consultee	Representation	POEPL response	Amendments/further detail
FC6	Oil Export Inshore transfer - Alternatives: There is very little evidence included within the EIS to support the choice of inshore transfer rather than offshore transfer as well as the current choice of location for inshore transfer. FC consider that inshore transfer poses the greatest risk to the environment and therefore believe every effort would need to be shown to keep transfer away from Berkeley Sound or similar sites. The EIS needs to include a more comprehensive and justifiable assessment.	POEPL recognises the importance of this issue to the environmental risks and performance of the project and also to its safety and commercial aspects and has done considerable work to understand the issues correctly and adopt the optimal approach. The choice of inshore transfer as the base case and the choice of Berkeley Sound as the optimal site is described over eight pages at Section 4.3.2. A more detailed justification for the choice of Berkeley Sound is referenced in this section - POEPL report "Environmental assessment of potential inshore transfer sites". This report is available for review. A summary of the decision process around Inshore Transfer versus Direct Offloading is contained in 'Additional Information'.	==
FC7	Significance of impacts The ZoI is rarely defined and other area reference terms are sometimes used which are not associated/conflicting with the ZoI such as 'North Falkland Basin' (pg. 409 and others). The baseline data is significantly overloaded with information that seems to fall outside the likely ZoI (which is usually undefined) for the impacts/risks identified e.g., coastal sensitivity indexes for areas beyond the extent of worse case spill models (pg. 435), terrestrial habitats that are included where highly unlikely to be impacted by marine pollution (pg. 417), Seabirds at Sea Data beyond oil	POEPL understand the point being made but this would involve a significant reorganisation of the document and it would not result in any differences in the outcomes. Therefore, POEPL do not believe it would be a good use of resources when stakeholders are now familiar with the approach taken. Composite diagrams have been produced illustrating areas of potential impact for different stressors e.g., the maximum footprint of drill cuttings deposition leading to a risk of >5% on a combined PEC/PNEC basis, but it is extremely difficult to make such diagrams accessible without applying significant degree of explanation e.g., where the significance levels are complex, or seasonally variable, or the impact has a statistical footprint. The assessment of the affected zone is also iterative in applying assessment methods that are specific to the receptor e.g., coastline types or cetacean species so it is rarely as cause-and-effect as the ZOI approach might suggest. We do not propose to include such diagrams but we would be happy to have a dialogue on good practice for future projects.	==

Consultee	Representation	POEPL response	Amendments/further detail
	spill models, NNR listings etc. It also includes features within a ZoI that are not defined (e.g., the very sensitive area on Fig. 147) or addressed i.e., designated sites (see below). It is repeatedly unclear which environmental receptors (ecological features) are considered appropriate to consider for each of the potential/known impacts. Resolution The Zone of Influence for potential impacts should be clearly and repeatedly identified. This should be done before summarising relevant receptors (ecological features that may be impacted) and baseline data as a necessary prerequisite to provide robust and clear assessment.		
FC8	Oil Export The statements imply there is now evidence to support feasible offshore transfer. Given the hugely significant reduction in impacts and risk on/to the environment that this would bring, it does not appear that inshore transfer would be a satisfactory alternative unless this potentially feasible offshore transfer option is ruled out (pg. 113 and 114). 1 CIEEM (2016) Guidelines for Ecological Impact Assessment in the UK and Ireland: Terrestrial,	As per response to comment FC6, a note has been prepared summarising the decision process around the export options, and a detailed assessment of inshore transfer sites is available to review.	==

	Freshwater and Coastal, 2nd edition. Chartered Institute of Ecology and Environmental Management, Winchester. (Section 2.19) It is not clear if the option to undertake inshore transfer has been selected because FIG and HSE have stated they will not support a safety case, or because PMO do not consider that they would. It appears to be the latter (pg. 113 and 114). Whilst perhaps environmental risk from spill is implicit in statements about safety of operations; the ordinance requires the indications of the main reasons for the applicant's choice to take into account environmental effects. There seems to be no direct consideration of environmental impacts for the various options included in the EIS. There seems to be a shortage of information to support statements, as well as references to studies which are not included in the EIS as part of the consultation (pg. 113 and 114). Resolutions The EIS should include an overview of the impacts and risks from each proposal (offshore transfer vs inshore transfer) to be able to balance environmental considerations with operating safety and economic viability. The EIS should include		

Consultee	Representation	POEPL response	Amendments/further detail
	further information to support statements of operating safety and economic viability as reasons not to pursue offshore transfer. The applicant needs to confirm whether FIG and HSE would, or would not, support the Safety Case in order to substantiate what satisfactory alternatives exist. This confirmation from the developer needs to be an agreed within a specific timeline with an accompanying review period. As minimum, FC believes this should be a condition of any consent.		
FC9	Env Baseline Whilst the Falklands marine environment is acknowledged as being data deficient or poorly understood few surveys were conducted for the EIS. Those documented within it were: 'mapping the shallow marine, intertidal and terrestrial habitats found within Berkeley Sound. a dedicated coastal bird survey of Berkeley Sound.' Surveys of Berkeley Sound (within a presumed Zone of Influence of an oil spill) did not include the globally endangered sei whale for which the	As per response to comment FC2, baseline data gathering has been building over many years towards the consenting of production operations in Falkland Islands waters and surveys for recent Exploration Wells campaigns were designed to be large in scale to support the assessment of production proposals. The Sea Lion Development EIA process has been guided by local experts *via* the Hydrocarbons Forum and GAP analysis. Satellite tracking has been ongoing throughout the exploration and project development phase. However, at the results of this work were not available at the time of writing. The initial results of the EU Best sei whale project are included in the ES. Although the sooty shearwater colony on Kidney Island was not surveyed, the importance of this colony, and Kidney Island, is well known, acknowledged and accounted for in the assessment. The EIS states that a large proportion of the Falklands population of sooty shearwaters and white-chinned petrels breed on Kidney Island and that an oil spill in Berkeley Sound during their breeding season could impact a significant proportion of the	==

Consultee	Representation	POEPL response	Amendments/further detail
	Sound is a candidate Key Biodiversity Area Surveys of Berkeley Sound did not include the 'Near Threatened' sooty shearwater, one of the key features of Kidney and Cochon Important Bird Area, to assess what impacts a spill could have on the internationally recognised site. Many thousands raft daily on the water in this area during breeding. No direct assessment of the habitats in the known Zone of Influence of the mooring buoy were made in Berkeley Sound.	regional populations, especially as sooty shearwaters form vast rafts close inshore before returning to their nest burrows. The structure of the EIS has been to examine groups of species, which includes an assessment of impacts on their habitats. We are conscious that the EIS has a 5-yearly period of validity under the Offshore Minerals Ordinance and would undergo a thorough review at such intervals, informed heavily by the ongoing working of the EMMP group and the results of monitoring of mitigations.	
FC10	Env Baseline The EIS does not contain tracking data from the GAP project (pg. 333). Is this information therefore not 'required to identify and assess the main effects' on the environment as per the OMO? The EIS acknowledges the requirement for further information (pg. 247). This section (repeated below) highlights areas where data should and could have been gathered ahead of an EIS submission (points 1,4,6,7,8,10 in list below) even with	Tracking data from GAP was not available in a form that was useable at the time of writing. However, initial results indicate that the distribution patterns used in the assessment are consistent with evidence from tracking and this supports the conclusions reached in the EIS. Much of the GAP higher predator tracking work is being rolled out onto other taxa - specifically flying seabirds from data collected by tracking programmes conducted by other scientific programmes in the Falkland Islands. This can be fed into the EMMP process along with other emerging scientific outputs that are inevitable as time passes. We believe these points are addressed in the assessments with sound data and with a clear method for addressing uncertainties recognising the FIG EIS	==

	opportunities and timescales available General 1. Impact of sea lion crude on fur; 2. Predicting the likelihood of introducing invasive species; 3. Auditory sensitivity of penguins and marine mammals; 4. Quantifying the impact of bird strikes; 5. Impact of long-term noise and actual noise outputs from the operations; Offshore environment (North Falklands Basin and Sea Lion Field): 6. Inter-annual distribution and abundance of marine mammals in the North Falklands Basin; 7. Benthic habitats and fauna at the Sea Lion drill centre and flowline locations specifically; Inshore environment (Berkeley Sound): 8. Benthic habitats and fauna at the Mooring Buoy location specifically; 9. Location(s) of loligo spawning grounds; 10. Inter-annual distribution and abundance of marine mammals. Points 2, 3, and 5 may provide some risk refinement but are unlikely to be clearly linked to oil industry activities and deliver management options (see EMMP below). Resolution	Guidance and with relevant points transferred to the EMMP *via* a logical process to ensure the correct level of management. 1. This is a commitment that affects detailed wildlife response and will be included in Oil Spill Contingency Plans. 2. POEPL has already funded an invasive species monitoring programme at the TDF and initial results are included in the EIS. 3. Auditory sensitivity of receptors is described in the EIS and has a substantial body of knowledge associated. 4. Bird strike cannot be baselined at this stage other than by reference to Exploration Wells activities where no birds were recorded in incidents involving the drilling rig, and a very small number were involved with vessels or inshore. 5. The JASCO monitoring provides a 12-month baseline of noise levels. 6. There are numerous datasets used relating to marine mammals spanning many years: tracking data of marine mammals funded through the GAP project in addition; the JASCO acoustic survey; the White, *et al.,* 3-year survey; and emerging datasets from other monitoring activities *via* the oil industry and conservation/research projects. These provide a wide spectrum of data on marine mammals at different times of year sufficient to draw conclusions for the EIS. 7. The 92-station benthic survey and scientific analysis characterise the area in detail. A site survey will be undertaken prior to locating the drilling rig and FPSO to clarify any specific local features. 8. The Benthic Solutions survey of Berkeley Sound was comprehensive and a site survey will be undertaken prior to locating the mooring buoy. 9. The oil properties show that toxic effects to squid eggs of any exposure to Sea Lion Crude are likely to be very limited, and the buoyant and relatively insoluble nature of the oil mean that interaction is limited. 10. There are many existing sources of data and local knowledge regarding marine mammals in Berkeley Sound and these are summarised in the EIS and a suitable for assessment purposes. POEPL are committed to gathering further marine mammal data offshore and inshore as part of EMMP efforts following project sanction.	

Consultee	Representation	POEPL response	Amendments/further detail
	The EIS should contain relevant data detailed above. It would be bad practice to make collection of these basic data a condition of a licence as once a licence is granted it can be potentially costly and difficult to alter the consented operations. It should certainly not be delivered as part of an EMMP as this is information that should be collected immediately to inform the EIS and before deployment of any infrastructure."		
FC11	Protected Areas There is lack of: -assessment of impacts against sites specifically and legal implications, -inclusion of important (international) site designations candidate Key Biodiversity Areas (KBA), KBAs and Priority KBAs, candidate Important Bird Areas, -understanding of the significance of particular designations. (pg. 424 '4 levels'; pg. 1236 Kidney is stated as 'nationally' significant whereas IBA designation is international). The FIG National Nature Reserve network is flawed in not having any key features identified and not having management objectives in place, therefore it is difficult to make good assessments of value and risk. However, international non-statutory	Designation of sites of conservation value in the Falklands is a developing topic, nevertheless the EIS has tried to use the available information to assess the impact on 'sites' in a consistent manner (as outlined in the methodology). It is noted that the scientific designations (such as IBA IPA, and IUCN status), while not necessarily affording legal protection represent outcomes of a systematic process. We have used all of these designations in the assessment, and so if an area is not formally protected, but is listed as an IBA for example, we have afforded it a level of importance. Key Biodiversity Areas (KBAs) are a relatively new concept for the Falkland Islands. The sensitivities associated with these protected areas are assessed in the EIS. The phrasing 'four levels' is perhaps unfortunate ('categories' might have been a better word) and was not meant to imply that there is a relationship between the listed designations, which are sub-divided into three rather than four categories (typo). The example on Page 1236 deals with the impact from oil spills in Berkeley Sound. In this instance, the impact on coastal habitats (terrestrial) is assessed and it was deemed that the greatest impact would be on species that rely on these habitats as foraging grounds (i.e., Cobb's wren in this case) rather than the seabird species breeding at a site that contribute to the IBA status of that site It is important to note that seabirds such as rockhoppers and sooty shearwaters, which breed on the	Changed 'four levels' to 'three categories'

Consultee	Representation	POEPL response	Amendments/further detail
	designations (IPA, IBA and KBA), provide criteria by which 'internationally important' sites, and key features are identified. Resolution Site assessments of all relevant designations within identified Zones of Influence should be included within the EIS."	Kidney island group, and King Penguins which breed at Volunteer Point (both IPAs), for example, are assessed separately as part of the 'seabirds' receptor. For the largest potential release of 50,000 tonnes, it cannot be ruled out that if these happened at specific times of year and with specific trajectories of oil, the features of some protected sites could be affected to the point where favourable conservation status is lost for a time. In the absence of a clear legal framework there is some legal precedent around the Habitats Directive which includes the concept of 'likely' significant adverse effects on site integrity. While 'likely' is given a very wide interpretation in the courts, it has been determined that 'extremely remote' outcomes are not in scope when considering whether a project should be consented, whereas reasonably foreseeable outcomes are in scope.	
FC12	Legislation Legislation and policy are the framework against which Environmental Impact Assessments (EIAs) are judged. They provide instruction or guidance to developers about what is acceptable with regards to development proposals or ongoing activities. A good EIA will consider its compliance with it and identify where its actions can contribute to policy objectives4 Issue/s - Falkland Islands policy, legislation and guidelines are not integrated into the EIS - Whilst there is some listing of policy and legislation this is incomplete: - No mention of the Development Plan which describes important policy	Schedule 4 of the Minerals Ordinance details the contents required within an Environmental Impact Statement (EIS) and we believe that the submitted EIS conforms with these requirements as summarised in Appendix A of the EIS. Each Chapter includes a summary of relevant legislation and related material which is then assimilated into the assessment. The Falkland Islands Development Plan is mentioned and has significant application to onshore development and infrastructure. Any onshore development will have to go through a separate planning process during which the Falkland Islands Development Plan will be of greater relevance. The Biodiversity Framework came into being part way through the production of the EIS. It is acknowledged that the Biodiversity Framework is the correct reference and the statements in the EIS containing Biodiversity Strategy should be read as Biodiversity Framework. It is acknowledged that the Conservation of Wildlife and Nature Ordinance does state that it is an offence to disturb nesting birds or any animals within a National Nature Reserve, however, it is not clear what constitutes disturbance. This is relevant to the section highlighted on page 570 but does not affect the outcome of the assessment. Targets 14 and 16 within the cetacean action plan refer to acoustic and physical disturbance to cetaceans and these issues are assessed. The Marine Mammal Ordinance provides a basis for the action plan as a management tool for Government. We note	Biodiversity strategy is cited in Chapter 10.4, amended to Biodiversity Framework

	on development and the environment, - The Biodiversity Framework is the primary national policy document for biodiversity in the Islands and superseded the old Biodiversity Strategy. The EIS repeatedly makes reference to species and habitats listed within the Biodiversity Strategy, - The EIS states no relevant legislation for 'disturbance' (pg. 570). Whilst the main piece of wildlife legislation the Conservation of Wildlife and Nature ordinance 1997, contains plenty of legal relevance to this, - Species Action Plans recognise the agreed approach to particular species within the Islands e.g., targets 14, and 16 in the Cetaceans SAP are of relevance, but are not included. The Falkland Islands wildlife legislation is dated and inappropriate for the globally significant wildlife supported by the Islands and includes little guidance for dealing with breaches. As the EIS correctly points out (pg. 608) there are no equivalent 'Disturbance licences', so it is difficult for developers to know what the next steps are to be compliant with legislation and policy; however, as a minimum the Development Plan lays out the reason to consider legally protected species within the EIS:	that the term 'disturbance' is also used in the UK *via* the Habitats Directive and is defined as "... to be likely significantly to affect (i) the ability of any significant group of animals of that species to survive, breed, or rear or nurture their young; or (ii) the local distribution or abundance of that species." In practice virtually no licences have ever been required or issued for deliberate disturbance for oil and gas projects. While further reference to plans and policies could be included, we believe impacts are adequately assessed in the EIS. Again, reference to the Falkland Islands Development Plan in the context of this EIS is relates mainly to development onshore and within the Territorial Sea. It is acknowledged that any such development associated with the Sea Lion Field will have to go through the planning process, which is likely to include a separate assessment of impacts where the guidance in the FI Development Plan is most relevant.	

Consultee	Representation	POEPL response	Amendments/further detail
	Policy SP5 'D. To protect the natural environment proposals must: 1. not have any significant adverse impact upon species protected by law (including their habitat)' Resolution The EIS should accurately assess compliance and identify actions that contribute to policy objectives to provide confidence that the EIS is written with an understanding of relevant Falkland Islands policy and legislation.		
FC13	Methodology The concept of As Low As Reasonably Practicable (ALARP) is widely used in the EIS. However, it is subjective - what is 'reasonable' to PMO may be 'unreasonable' for FIG or stakeholders for example. This is important when considering the adequacy of mitigation, particularly for ecological receptors. In the EIS, what is 'reasonable', is dictated to decision makers and stakeholder by the applicant, as well as what further action should be taken (pg.54 Table 6, Table pg. 65 as examples). - The significance of risk is dictated by the applicant, as again are the	The current Ordinance and EIS Guidance operates on conditions of mitigation being triggered by a significant impact, in common with much worldwide EIA legislation. POEPL has followed this method and also gone further where possible by using ALARP *in situ*ations where the impact is non-significant. POEPL do not agree that significance is dictated by the applicant; for each category of impact there is reference to international protocols and standards for assessing risk and impact as appropriate and these have been evolved through previous experience in the Falklands as well as POEPL experience worldwide and the experience of our specialist advisors locally and worldwide. POEPL welcome feedback on any topics where respondents believe alternative significance levels could be used.	==

Consultee	Representation	POEPL response	Amendments/further detail
	subsequent actions, such as offsetting (Table pg. 65). - Risk categories should be more clearly explained in order to allow decision makers to make informed judgements i.e., for 'moderate risk' a nationally important site could be 'temporarily' impacted (timescale unknown), or a site of less importance could be destroyed. - The EIS does not deliver 'no net loss' and has little evident aspiration for environmental 'net gain' Resolutions The proposed development should clearly deliver 'no net loss' as minimum. The risk assessment is 'leading', it should not conclude decisions/actions on behalf of decision makers.		
FC14	Offsetting Whilst PMO may not have permanent in-house expertise on offsetting (pg. 52), consultants are there to fill this expertise gap. It is disappointing that little thought seems to have been put into offsetting projects proposed within the EIS. For example, impacts on petrel populations from bird strike could be offset by rat or mouse removal at small petrel sites that would reduce pressure on colonies, or low spill lighting in town could	As per response to comment FC4, POEPL has been given a choice to self-manage offsetting or give responsibility for choosing offsetting projects to FIG *via* an Environment Fund. Agreement has been reached on the latter option.	==

	reduce sooty shearwater collisions; disturbance at penguin colonies could be offset by wardens or improved fencing/markers at sites already under disturbance pressures. - The lack of offsetting projects also seems to be argued on the absence of exact quantitative information. In this situation the decision is made by the developer as to whether to do nothing i.e., leave an impact, or propose something that is relevant and shows desire towards 'net gain', if not 'no net loss' as minimum, and could result in beneficial impacts overall. - Carbon: the development proposal will generate over 9.5 million tonnes CO2 in its Field Life (pg. 770), increasing the Falkland Islands production by around 340 % in that period. Again PMO have made no proposals for offsetting projects and instead propose payments to an offsetting fund. - Proposals for contributions to a fund provide no values, so it is not possible to determine whether the payments to a fund would cover projects that would offset identified impacts i.e., reasonably proportional to the calculated emissions projections. Carbon credit/trading schemes start around $1 at the		

Consultee	Representation	POEPL response	Amendments/further detail
	bottom but up to $20 per tonne. The EU Emissions Trading Scheme is currently c€10 per tonne. - The offsetting fund has not been set up, so there is currently no legal mechanism to ensure that money being provided by the developer for offsetting will be used appropriately. Resolutions The offsetting proposals need to provide better justification for not exploring indirect offsetting project proposals. The offsetting proposals for contributing to a fund need to state a value that can be judged to be commensurate with delivering offsetting to provide 'no net loss', and for carbon for comparability with carbon credit values.		
FC15	EMMP EMMP is being used to gather baseline data that should have been done for the EIS - EMMP is not being focussed on uncertainty of impact categories or mitigation - EMMP is being used to gather data that cannot be attributable to oil activities and therefore cannot guarantee positive management. Examples of EMMP actions - Marine Mammal Observers to check for cetacean collisions/ near miss	POEPL disagree with statements around baseline data. POEPL believe the EIS has sufficient baseline data to comply with the legal requirements and in some cases far more than would be found in equivalent applications in other regions. POEPL believe the EMMP subject matter has been determined in a logical way connected to significance, sensitivity and uncertainty. Seabird/MMOs will be employed on vessels to monitor for presence and behaviour of seabirds and marine mammals who will advise on direct actions e.g., to avoid collisions or alter speed if high densities of mammals are encountered. POEPL will certainly discuss the results of monitoring e.g., for bird strike *via* the EMMP forum and directly with regulator and determine the best course of action, and it is possible that this could involve trigger	==

	whilst vessels are operating – if above acceptable threshold change vessel activity Code of Conduct to more precautionary, - Seabird Observers to check for bird strike, set acceptable limits - if above acceptable limit change lighting type/timing/spill etc., - Data needs collecting on actual anchorage area Zone of Influence before consent. If habitats prove to be valuable, but impacts are argued against, then monitor anchorage Zone of Influence and change location if impacts are large. - If dynamically positioned tankers have significantly different noise outputs to other vessels using the Sound, monitor occurrence of cetaceans, change location/engines/timing, - If utilising higher risk areas than existing fishing, or bunkering vessels - monitor ballast water and hulls for species that could survive, improve hull cleaning and ballast water treatment. Resolutions EMMP proposals are not acceptable and should be revised to meet the generally accepted requirements of EMMPs. Contributions to broadly relevant, but non-EIA essential wider	levels of impact. We have committed that the DP shuttle tanker in Berkeley Sound will employ an SMMO to monitor and record specific reactions. POEPL confirm that offshore, site-specific seabed surveys will be undertaken prior to laying anchors or installing infrastructure. Similarly, inshore surveys will be undertaken at the mooring buoy anchor locations which will allow any fine tuning to avoid specific features. POEPL are committed to monitoring measures for ballast water and invasive species and to hull inspection for construction vessels to be anchored in Berkeley Sound.	

Consultee	Representation	POEPL response	Amendments/further detail
	environmental monitoring, where management actions cannot be undertaken, should be delivered outside of the EIA process. Once appropriate, EMMP commitments should be part of strict licence conditions."		
FC16	Spill Prevention/ Response Oil response strategies (including for oiled wildlife) were not included within this EIS, neither was it clear during the consultation that three response strategies (Offshore, Inshore and Stanley Harbour) were available, which is disappointing. - Metocean data is available for both the offshore and inshore operational sites, and thus the inclusion of models to inform on the ability of the operator to carry out effective and sustained spill responses and subsequent remediation needs to be included - critical for decision makers to fully understand the consequences of not being able to carry out a response to an oil spill. - The operational Oil Spill Contingency Plan (OSCP) and Oiled Wildlife Response Plan (OWRP) are proposed to be submitted at a later date before operations commence. According to the PMO Oil Spill Strategy for Inshore Crude Oil	The Oil Spill Strategies (for Offshore, Inshore and Stanley Harbour) were available during the consultation period and advertised at the public meetings and in the Data Room. They were provided to FC in request during the consultation period. Metocean data and modelling services will indeed be available to the ongoing operations including metocean and spill fate and the development of this work has been presented at numerous forums over the last few years. POEPL is obliged to ensure its plans interface with the NOSCP and Falkland Islands Oiled Wildlife Plan, although its response is not reliant on those resources. We look forward to discussing the development of the operational OSCPs with FIG and FC in their respective capacities as described in the NOSCP after the project has been sanctioned. POEPL is committed to understanding the adhesion of oil to pelts to include in our wildlife cleanup procedures. POEPL recognise that two of the main impact mechanisms (feather oiling and water-soluble toxicity) are less significant with this oil type than typical crude oils, given its solid and relatively non-adhesive nature and its low proportion of soluble and aromatic components. After many oil spills, birds die due to ingesting the oil that they preen off their feathers, and we can expect much less Sea Lion crude to be present on feathers than with most crude oil types. This leaves the pathway of ingestion of water borne wax. The ingestion of oil is a major pathway for all oil spills as it becomes biodegraded, and POEPL has specifically included the expertise of Dr Anton Wolfhaardt in the EIS team, who has direct experience of oil ingestion in penguins amongst other animals, to provide robust scientific advice. POEPL recognise that the high wax content, low solubility and particulate nature of the residual oil is	==

	Transfer Operations these plans will interface with theFalkland Islands National Oil Spill Contingency Plan (NOSCP) and the Falkland Islands Oiled Wildlife Plan, therefore placing a potential resource and financial commitment on FIG and other stakeholders (e.g., FC). Conditions should be set by FIG which include realistic time-frames to inform stakeholders, investigate, develop and disseminate plans for approval and well in advance of operations commencing. - Further investigations of oil behaviour on wildlife is required. There are still many unknowns regarding the interaction of Sea Lion waxy oil with wildlife. A recent study suggests ocean-borne plastic has a smell that marine animals find appealing Proceedings of the Royal Society B, DOI: 10.1098/rspb.2017.1000. Further studies are essential that investigate whether in an oil spill incident Sea Lion oil as solid wax balls are attractive to marine wildlife and incidentally consumed, as well as the continued testing of the oil on marine wildlife pelts. - Further investigations are required to trial and test logistical capabilities of oil spill plans in advance of	unusual and we will continue to investigate this topic post-sanction of the project. POEPL is committed to undertaking *in situ* spill response exercises prior to operations commencing and regular exercises will be undertaken to internal and legal requirements. Financing of oil spill liabilities is a requirement for all POEPL operations worldwide and further information on the levels of insurance cover routinely provided are given under Additional Information.	

Consultee	Representation	POEPL response	Amendments/further detail
	submitting these to FIG. For example investigating seasonal weather conditions and resource limitations. As examples, tents used as temporary animal shelters may not be suitable in a windy climate. There needs to be consideration of rehabilitation in a cold climate - use of outdoor pools will not be suitable. There is no mention of sourcing food supplies for the duration of rehabilitating wildlife. Resolutions More data should be provided on oil behaviour with wildlife and trials carried out to test feasibility of the logistics of response plans.		
FC17	Legislation The EIS appears not to be compliant with the OMO in not providing details on decommissioning. - There is no mention in the EIS of finance for decommissioning (pg. 211). Resolution To be compliant with the OMO the EIS should include the decommissioning phase of the proposed development. There needs to be a clear commitment to be able to decommission even if the developer is in financial difficulty.	It was agreed with FIG that in this EIS POEPL would provide a high level description of measures taken in design to facilitate decommissioning, but that a full plan and assessment of the impact of decommissioning will be undertaken near the end of the field life. It is considered that this approach is consistent with OMO (Amendment) 2011 – Section 6. Remediation. This is also the current approach on the UKCS (BEIS EIA Guideline, Feb 2018), "There is no requirement to provide detailed information in relation to how removal will be achieved at the time of abandonment or decommissioning, or to provide a demonstration of the likely significant effects of the activities." Decommissioning was discussed with EPD and DMR in November 2015 and it was agreed: - In summary, a high level description will be given with a base-case of complete removal of all structures. However, due to uncertainty as to how that will be achieved and potential for technological developments, it is not meaningful to assess the impact of the removal process at this time. A full	==

Consultee	Representation	POEPL response	Amendments/further detail
		plan and assessment of the impact of decommissioning will be undertaken near the end of the Field life. This is the approach taken in the UK. - It was agreed in principle by all that this was reasonable and would comply with the current ordinance. It is a standard clause in petroleum production licences that operators must have financial provision to cover decommissioning costs and it is normal for them to demonstrate this periodically to the regulator, and we expect this to be covered in the Field Development Plan. This obligation would transfer to any new owner with the licence.	
FC18	Env Baseline Why would only globally threatened species be included? There is a Falkland Islands Red List for nationally threatened plant species – this shows poor understanding of conservation status indicators.	This section of the EIS reviews information contained in the Important Plant Area directory and nationally important plant communities are covered on page 432.	As a marine-based project, plants are largely irrelevant and therefore the EIS only contains a very brief description of the flora of the Falklands. Any on-shore development will have to undertake a separate EIA and it is here that more detail on plants is required.
FC19	Env Baseline Why are only seabirds considered and then narrowed to penguins when all nesting birds are protected under the CoWNO? Further, why are seals included when they are not protected and are Least Concern? This shows poor understanding of legislative and conservation relevance.	The focus of this chapter is disturbance to colonial seabirds and marine mammals as these are the receptors that are known to be vulnerable to disturbance from aircraft. These were identified as the main receptors in the ENVIID workshop. Much of the research on impacts of helicopter noise on seabirds has focussed on penguins, and so the literature review and distillation of the main findings reflects this. However, the EIS does identify (small) Southern Giant Petrel colonies in the north of East Falkland as being susceptible to the impacts of helicopter noise.	==
FC20	Env Baseline King Penguins are increasing in numbers and are 'Least Concern' globally, Volunteer point holds less than a percentage of the world population. Southern Rockhopper are	Although we accept King penguins are classified as 'Least Concern' by the IUCN, and their population in the Falkland Islands is arguably insignificant in global terms, it is almost entirely concentrated at the colony at Volunteer Point, which is also a significant tourist attraction. Furthermore, King Penguins are known to be especially susceptible to disturbance from low flying aircraft (Cooper *et al.,* 1994, Hughes *et al.,* 2008, Giese and Gales	==

Consultee	Representation	POEPL response	Amendments/further detail
	decreasing in numbers globally and are' Vulnerable'. Why would the king penguin colony be valued higher than the southern Rockhopper colonies - this shows poor understanding of conservation value.	2009). The text does not indicate that king penguins are valued higher than rockhoppers on the grounds of conservation status or global population trends. The fact that king penguins are present year-round and virtually the entire Falklands population breed at a single site are more relevant, however, the sensitivity of king and rockhopper penguins is regarded to be the same in this assessment.	
FC21	Env Baseline States there are no population estimates for cetaceans, but the current SAERI Dolphins of the Kelp project has provided population estimates are for Peale's and Commerson's dolphins and the FC sei whale project provided a minimum individual count for Berkeley Sound which is reported in the EIS but not used further. Shows lack of up- to-date information.	At the time of writing, the results of SAERI's 'dolphins in the kelp' project were not available.	==
FC22	Env Baseline Reasonable to assume with species that are 'threatened' due to declining populations, such as Southern Rockhopper, that temporal or low level impacts can be treated as 'within the natural variation of the population' (pg. 657 and pg. 737) as the population is considered outside of this natural variation. This is acknowledged on pg792 so should be consistently applied throughout.	Unfortunately, we cannot find precise wording quoted in the EIS. With regard to rockhopper penguins, page 657 says 'such that the level of disturbance would be barely detectable above background variability'. This reflects the background level of disturbance already experienced that is compatible with their existing conservation status. It is not intended to suggest that noise impacts will cause population changes or that significant impacts are being dismissed.	==
FC23	Env Baseline The IUCN Red list category for Black-browed Albatross is actually Least	The status of black-browed albatross has changed several times in recent years (from Endangered in 2013 to Least Concern now) and the current status which changed late in 2017 after finalisation of the EIS. Additionally,	==

Consultee	Representation	POEPL response	Amendments/further detail
	Concern. Shows lack of up-to-date information.	tussock birds are now regarded as endemic to the Falkland Islands which is not reflected in the ES but which does not change the assessment.	
FC24	Env Baseline Whale numbers are considered increasing in the Islands and the presence of Southern Right Whale in numbers in 2017 which are more prone to ship strike will increase the risk of ship strike from that considered in the 2008 cetaceans Species Action Plan. The EIS has a lack of up-to-date information on cetacean ship-strike as last year there was one observed near miss with the Concordia Bay and one reported strike with a launch.	Unfortunately POEPL and the EIA team have not received this information and we are unclear how it is published.	==
FC25	Significance of impacts Why is the North Falkland Basin inferred as a Zone of Influence for exposure of cetaceans to an oil spill when there is a spill model? Demonstrates poor understanding of EIA process?	The North Falkland Basin is used throughout the EIS to refer to the broad zone around the offshore Development area. It is not implied that any potential impacts are restricted to this area or occupy the whole area, but it is considered useful to characterise the receptors, such as cetaceans, within this area. The oil spill modelling predicts specific areas within which oil might be expected, the likelihood, character and length of time present all of which are presented in the EIS and supporting strategies.	==
New Island Conservation Trust (NICT)			
NICT1	Artificial Light There does not appear or be any real attempt to deal with lighting and bird-strike. In a neighbouring territory (South Georgia) new illumination standards have been introduced to mitigate bird strike. Might lessons be learned from that	POEPL welcome feedback on developments in this emerging area and we will make enquiries. POEPL has committed to applying OSPAR Agreement 2015-08 on minimising risks to birds from artificial light, which involves examining available techniques and balancing safety and operational requirements and this can include reviewing the standards and lessons from South Georgia. Inevitably the detail of lighting design, fittings, shielding, lamp types, lighting philosophy for safe operations etc. must take place post-EIS approval when detailed design and rig selection is being undertaken."	N.B. There are not any new illumination standards on South Georgia to mitigate bird strike.

Consultee	Representation	POEPL response	Amendments/further detail
	territory and adopted offshore the Falkland Islands?		
NICT2	Spill Prevention/ Response There appears to be a lack of wildlife response plan: there are indications that it will follow. Any EIS should be include sufficient detail to form the basis of realistic mitigation. New Island birds, in theory, could be impacted, given their migratory pathways.	The strategy for wildlife response is included in the Offshore and Inshore Oil Spill Strategies that were available during the public consultation. See Additional Information for an extract that describes the wildlife response. Birds relevant to New Island populations are included in the EIS baseline and impacts including petrel, prions, albatross, shag and penguins. Research conducted at New Island has been a valuable source of information for the project.	==
NICT3	EMMP The Environmental Monitor and Manage Plan looks more like just a monitoring plan (few management proposals), with lots of money potentially spent on monitoring, but no options/solutions for actually managing, should impacts be detected.	The purpose of the EMMP is to define the management actions and resources required, respond to the priority data gaps/areas of uncertainty identified in the assessment, and importantly to assess and monitor the effectiveness of the mitigation measures during all stages of the proposed operation, and based on this monitoring to help underpin an adaptive approach to the management of the operation to prevent or reduce risks to the environment. Since the assessments have been precautionary in general, uncertainties tend to manifest as monitoring to observe whether the 'potential' impact materialises. If it does not, the management solution is to agree a more realistic impact rating and reduce or remove the monitoring.	==
Member of Public A (MP)			
MP(A)1	Legislation The Harbours and Ports Bill 2017 and the Maritime Bill 2017 were published in the Falkland Islands Gazette Supplement No 9 and 10 dated 16 June 2017 and were passed into legislation by the Legislative Assembly at their meeting in September 2017. These Bills were published in the Falkland Islands	POEPL recognise these changes which we were not able to include in the EIS drafting cycle. We accept the wording can be expressed more accurately and we are grateful for the summary provided.	==

Consultee	Representation	POEPL response	Amendments/further detail
	Gazette Supplement No 2 & No 3 dated 31 January 2018 as the Maritime Ordinance 2017 and the Harbours and Ports Ordinance 2017. The Maritime Ordinance in particular contains a raft of legislation relating to offshore oil pollution. The comment that the legislation is being updated is inaccurate as the primary legislation is in place.		
MP(A)2	Oil export An export route by directly offloading the crude from the FPSO remains the preferred route for Islanders in order to reduce risk from accidental spills into to the environment from inshore transfer, particularly on inshore coastlines. It is helpful to see that POEPL make reference to a direct offloading route but the EIS is very scant in detail about how this will be taken forward, if at all, once the route through Berkeley Sound is established as the base line. It would be more convincing and informative to have details about what would be involved to achieve offshore transfer: i.e., access to dynamically positioned tankers and other technology under development. There needs to be a guarantee that POEPL will report on their findings regarding an offshore	POEPL recognises the importance of this issue to the environmental risks and performance of the project and also to its safety and commercial aspects and has done considerable work to understand the issues correctly and adopt the optimal approach. The choice of inshore transfer as the base case and the choice of Berkeley Sound as the optimal site is described over eight pages at Section 4.3.2. A more detailed justification for the choice of Berkeley Sound is referenced in this section - POEPL report "Environmental assessment of potential inshore transfer sites". This report is available for review. A summary of the decision process around Inshore Transfer versus Direct Offloading is contained in 'Additional Information'.	==

Consultee	Representation	POEPL response	Amendments/further detail
	route every two years or such timescale to be agreed with the Regulator. These evaluations, feasible or not, should be made public. It is important to keep the issue live as it is assumed that the success of Phase 1 will lead to proposals to move to Phase 2 with more activity in Falklands' inshore waters, possibly beyond the capacity of Berkeley Sound, if no offshore transfer model is developed.		
MP(A)3	Artificial Light It is encouraging to read that POEPL intends to check the practicalities of adopting a green lighting strategy during FEED and to review pilot- free flare designs using an automated ignition system to prevent or reduce bird strikes. However, POEPL does not confirm commitment to these strategies if feasible. Nor does the company commit to a no flaring policy during the hours of darkness without express approval from the Regulator in justified circumstances. These matters need further consideration and commitment in the EIS. It is acknowledged that a Bird Strike Management Plan will be developed but policy assurances need to be stated in the EIS.	POEPL acknowledges the concerns around artificial light. POEPL are committed to applying OSPAR Agreement 2015-08 on minimising risks to birds from artificial light, which involves examining available techniques and balancing safety and operational requirements. Inevitably the detail of lighting design, fittings, shielding, lamp types, lighting philosophy for safe operations etc. must take place post-EIS approval when detailed design and rig selection is being undertaken. POEPL has committed to investigating non-pilot flares but we note that they must be extremely reliable to be accepted as Safety Critical pieces of equipment and this includes a track record of successful deployment in similar operations in an offshore setting. The EIS notes that a Bird Strike Management Plan is required prior to operations commencing and this is also included in the EMMP, and a BSMP was in place for previous exploration well operations. No bird strikes were recorded on the drilling rig in previous operations, which included flaring. POEPL has no objection to consulting with FIG on operations involving high amounts of flaring, and we will prioritise the scheduling of planned flaring for daylight hours e.g., prior to shutdowns. There are, however, also situations where immediate depressurisation is required for safety reasons that cannot be delayed.	==

Consultee	Representation	POEPL response	Amendments/further detail
MP(A)4	Waste The cumulative effect of 20 years of waste generation on the Falkland Islands is a concern. The EIS states that it is planned that some hazardous wastes, ash from incineration etc. and recyclable items will be taken to the UK (Scotland) for disposal. It is acknowledged that POEPL will prepare a Waste Management Plan for FIG approval before development can proceed, but it would be reassuring to have confirmation that procedures and approvals are readily in place for shipping waste to the UK from the Falkland Islands. Many of us are aware of the increasing issues related to shipping and receiving waste around the world and there needs to be assurances in the EIS that the UK will accept waste of the types described in the EIS that are generated here. Shared facilities developed with FIG and MOD over time may reduce this requirement but not remove it entirely.	Clearly POEPL's preference, and international good practice, is to adopt the proximity principle and manage waste as closely as possible to the source. We strongly welcome recent developments by EPD and PWD to improve the understanding of waste needs, to engage relevant parties on-island and to look forward to waste handling, treatment and disposal methods. POEPL has experience of returning wastes to the UK gained during previous campaigns so we know that this route is available, and there is no obvious legal impediment provided it is demonstrated that there is no viable outlet in the Islands. Waste export/import policies are summarised in POEPL's Waste Management Strategy which we are happy to supply. POEPL are certainly willing to approach the UK waste regulators to obtain their reassurances on such issues, although it may raise wider questions about the existing facilities and forward plans for waste from the Falkland Islands in general beyond the needs purely of the Sea Lion project that would require governmental input. It is important to note the two most important positive messages, which is firstly that by embedding thermal treatment into the choice and design of drilling rig, we will be able to treat the majority of the wastes (oily drill cuttings) offshore to a high standard without recourse to onshore treatment. Secondly our investigations into portable incinerators show that they are feasible and efficient and will deal with the majority of the remainder of the wastes, such that the residual items are a far smaller problem to manage.	==
MP(A)5	Waste People are questioning the use of plastics particularly during offshore activities and the need to ensure nil discard into the sea. The South Atlantic is relatively plastic free	POEPL's offshore operations anywhere in the world forbid the overboard release of waste and it would be contrary to IMO international rules. POEPL include measures in waste management offshore such as compactors and containers to prevent waste from becoming wind-blown and to ensure that loose items are sea fastened during adverse weather. POEPL completely support the minimisation of waste through our ISO14001 Environmental	==

Consultee	Representation	POEPL response	Amendments/further detail
	compared to other oceans but not entirely so. More detail about initiatives to reduce the use of plastics in the first place, and procedures for control and disposal of those used would be welcome in the EIS, in addition to the references to education and training of the work force in management of plastic and other waste.	Management System that is externally certificated and we use biodegradable plastics where possible in our onshore facilities. On all POEPL facilities the offshore crews undergo an induction that is specific to the operations. At Sea Lion this would inevitable include basic training in wildlife response, reporting of bird strike, the importance of minimising artificial light and the specific issues around litter prevention and waste disposal. When POEPL appoint service companies, the importance of environmental performance in this region will be impressed on them and reflected in their Key Performance Indicators.	

Table A3-2: Summary of the representations made during the 2020 statutory consultation process on EIS Rev B04

Consultee	Representation	POEPL response	Details in
Offshore Petroleum Regulator for Environment & Decommissioning (OPRED)			
OPRED1	1. Areas of uncertainty Although there are number of uncertainties regarding the proposals at the EIS stage, OPRED do not believe they are material to the conclusions drawn for the offshore development proposals.	POEPL acknowledges and welcomes the comment, which supports the findings of the EIS.	
OPRED2	2. Oil export options Since OPRED's previous review in March 2018, POEPL have taken the decision to select a Direct Offtake from the FPSO in field. OPRED recognise this as the best environmental option.	POEPL acknowledges and welcomes the comment, which supports the findings of the EIS.	
OPRED3	3. Drilling operations OPRED note that POEPL propose to use Water-based Mud (WBM) for the drilling of the top-hole sections and Non-Aqueous Drilling Fluid (NADF)(Oil Based Muds (OBM)) for the lower sections, which is standard UK practice. The batch sequencing of the sections will minimise the mud wastes as this method reduces the need for changes in the mud system. It is also noted that OBM contaminated cuttings will be processed through a thermo-mechanical cuttings cleaner and will be discharged with <1% dry weight on cuttings, which adheres to requirements of OSPAR Decision 2000/3. If the unit cannot be used, cuttings will be shipped to shore. The tophole sections of the proposed wells will be drilled using water-based mud and a suite of chemicals that are predominantly classed by OSPAR as PLONOR (Pose Little Or No Risk), and the overall impact on benthic fauna from the cumulative discharge of the drill cuttings is considered, as a precautionary conclusion, to be moderate. However, modelling indicates a comparatively small area of impact which will reduce significantly over a 5 year period and recolonisation is expected after 1-2 years (and the sensitivity of the receptor is considered to be low). OPRED would agree that the EIS assessment is precautionary.	POEPL acknowledges and welcomes the comment, which supports the findings of the EIS.	

Consultee	Representation	POEPL response	Details in
OPRED4	Produced water POEPL intend to use Produced Water Re-Injection (PWRI) and therefore there will be zero discharge of produced water. However, in the event produced water discharge is unavailable either during commissioning or operationally the monthly average of Oil in Water concentrations from produced water discharge will be below 30mg/l, which aligns with UK Regulations. It is also noted that the expected concentrations are 10-15mg/l, which is in line with current industry expectations. If the oil in water concentrations are higher than this there is provision for the fluids to be diverted to an off-spec tank.OPRED also note that there is the intention to apply a Risk Based Approach to identify any potential issues.	POEPL acknowledges and welcomes the comment, which supports the findings of the EIS.	
OPRED5	Operational chemicals As the chemicals will be compliant with the UK Offshore Chemical Notification Scheme (OCNS), OPRED can assume that the risk to the marine environment are unlikely to be significant. In addition, POEPL have committed to only using chemcials with a HQ band Gold, with no product or substitution warnings. However, as the specific chemicals and dosages are yet to be confirmed and OPRED would suggest that given UKCS experience this could be a challenging commitment. OPRED would advise that relevant chemical risk assessments be undertaken prior to chemical usage.	POEPL has committed to select 'Gold' or 'E' rated chemicals where possible and any exceptions to this will be fully justified. POEPL acknowledges the comment that specific risk assessments of chemicals should be done prior to chemical usage as has been done in the past, for example, prior to the exploration well campaigns. Through this process, risks will be minimised and good practice in chemical selection will be undertaken.	
OPRED6	6 Environmental baseline Overall, the EIS provided an comprehensive description of the environment and covered all of the salient issues. The level of environmental survey work undertaken provided an informed and contextual description of the development area which was very beneficial. It is also reassuring to note that through the Gap Analysis Programme further work will be undertaken to address data gaps at a regional level to aid the understanding of the Falkland Islands marine environment.	POEPL acknowledges and welcomes the comment, which supports the findings of the EIS.	
OPRED7	7 Noise assessment Whilst OPRED would agree with the conclusions of the assessment	Notes and a reference have been added to the EIS Section 10.4.4.4.1 on noise from mobile	Notes and a reference have

Consultee	Representation	POEPL response	Details in
	of underwater noise impacts (Section 10.4), OPRED found it difficult to correlate between the many sub-sections. Although there was mention of drilling noise as a non-pulsed source, OPRED would question why a detailed assessment of vessel noise was undertaken but there wasn't a similar assessment for the drilling operations?	drilling units. When operating, anchored drilling rigs have a low noise output, typically some 30 dB lower than the other sources present (vessels on dynamic positioning or using propulsion frequently), so were scoped out of the predictions. Reference: DECC (now BEIS) (2011) 'Review and Assessment of Underwater Sound Produced from Oil and Gas Sound Activities and Potential Reporting Requirements under the Marine Strategy Framework Directive'.	been added to the EIS Section 10.4.4.4.1 on noise from mobile drilling units
OPRED8	8 Accidental pollution events OPRED is satisfied with the information provided within the EIS. Since the start of the EIS consultation period, POEPL have presented further information regarding the oil characteristics and the potential for a spill event to occur. The information provided concludes that the oil is heavy and has a significant wax content related to a high pour point and subsequently the reservoir requires additional pressure for flow to surface. A significant uncontrolled reservoir flow is therefore unlikely. Due to its characteristics, in the marine environment it would solidify almost immediately and no emulsification would occur.	POEPL acknowledges and welcomes the comment, which supports the findings of the EIS.	
OPRED9	Our overall conclusion is that the information provided in the EIS indicates that the proposed Sea Lion development is unlikely to have a significant impact on the local South Atlantic Ocean environment, and we would be grateful if you could forward our comments to FIG.	POEPL acknowledges and welcomes the comment.	
Scottish Association for Marine Science (SAMS)			
SAMS1	Benthos 'B' An extremely detailed technical document that presents the available data on benthic habitats and communities in a clear and accessible manner. The report displays a familiarity with the relevant peer-reviewed literature (e.g., relating to major oil spills in	POEPL welcomes the 'B' rating. In response to a perceived lack of benthic information offshore, POEPL believes it has approached this topic in a positive way. The existing taxonomic literature for the region is outdated and many	Text updated to make this clear.

Consultee	Representation	POEPL response	Details in
	temperate marine environments) and information from previous EIAs. It displays an appropriate level of understanding of the sourced literature, and where appropriate applies the findings to the study areas. The B rating given for the Topic Assessment Score reflects the relative lack of information on benthic communities in the Sea Lion drilling area offshore. With respect to inshore locations in Berkeley Sound, an A rating could be assigned.	species in existing literature are likely misidentifications. Many species retreived from the benthic surveys were identified with the help of the Natural History Musuem and this work continues. 25,000 polychaete (Annelida) specimens, representing at least 233 morphological species were processed at the Natural History Museum. Taxonomic assessment led to recognition of many polychaete species that are new to science. Initially, an online taxonomic guide was created (http://falklands.myspecies.info), to provide a single taxonomic source for 220 polychaete species to standardize identification across different environmental contractors. This is described in a paper submited to ZooKeys that also formally describes 6 new species to science. Work on crustacea is ongoing in a similar way.	
SAMS2	Biosecurity 'A' Well presented, researched and consistent with international guidance and Best Practice measures used to minimise the likelihood of new introductions of Non-Native Species. The risk scores were justified and additional mitigation measures including monitoring established. The limitations were acknowledged and measures put in place (EMMP) to minimise risk and address uncertainties. Overall, a very concise a detailed risk assessment made for Biosecurity.	POEPL welcomes the 'A' rating.	
SAMS3	Fisheries, Fish and Plankton 'B' Overall, the assessments of impact of the project on plankton, fish and fisheries were reasonably well justified. A couple of the fish sections were not as well written or structured as other parts, and could do with a bit more work (see Section 5 for details). There also	POEPL welcomes the 'B' rating. These points raised have been addressed with changes to the relevant narratives in the EIS, which are of a minor nature. There was some misunderstanding around the 'zones' in terms	Section 7.4.4.2.1.1 Figure 7.46

Consultee	Representation	POEPL response	Details in
	appears to be a few instances where assumptions have been made and not supported with appropriate references to scientific studies. This needs to be remedied, or it needs to be made clear that these are assumptions for which there is no strong evidence.	of fish communities and the definitions and use in terms of 'sub-zones' have been tightened. The Falkland Islands Conservation and Management Zones (FICZ and FOCZ) delineate the extent of the Falkland Islands EEZ, and six main habitat zones have been identified within this area characterised by a combination bottom topography, bathymetry, water structure and hydrodynamics. These zones are explained in detail by Arkhipkin, *et al.* (2012a). It is very clear that they are environments that represent temperate or sub-Antarctic fauna. Some of zones are quite wide. However as noted in the EIS the shallow-water area of the NS (250-350 m) is heavily fished for finfish and skates throughout the year. The remainder of the NS (>350 m) is not important to the fishery at all. The text has been amended to take account of this and amended Figure 7.46 with respect to the habitat zones.	
SAMS4	Global Atmosphere 'A' The Sea Lion Development - Phase 1 Environmental Impact Statement was assessed on its treatment of impacts to global atmosphere. The various stages of the development from the Mobile Offshore Drilling Unit (MODU) to transfer of oil were covered, by activity. Planned global atmosphere impacts to unplanned such as maritime accidents were covered. Activities offshore were examined as well as inshore. Numerous scenarios at different contamination levels and from different sources were covered. The literature was adequate and relevant. The sections on global atmosphere impacts are what one would expect to see in an EIA prepared for the UK oil and gas sector.	POEPL welcomes the 'A' rating.	

Consultee	Representation	POEPL response	Details in
SAMS5	Regional Air Quality 'B' Additional information has been provided concerning an assessment of the potential impact of volatile organic compounds (VOCs) resulting from an unplanned oil spill on regional air quality. The modelling undertaken, combined with the presentation of a case study from the MV Braer event, shows that likely impacts would be minimal. It is suggested that the additional document might be annexed into the EIS to add evidence as to why such potential pathways of impact have been screened out of the assessment.	POEPL welcomes the 'B' rating. POEPL believes the comment refers to work done previously in modelling VOC concentrations from a very large crude oil release in Berkeley Sound, which is no longer a scenario under consideration. The EIS Section 12.2.4.2.5 discusses the evidence from the Braer incident and 12.2.6.4 notes that the potential incidents in Berkeley Sound are far smaller. POEPL believes the material presented provides a proportionate amount of analysis and justification.	
SAMS6	Marine Flora 'A' The EIS has identified kelp beds as particularly important as primary producers in relation to the inshore site at Berkeley Sound with the giant kelp Macrocystis pyriferia the dominant species. Overall the report coverage of kelp beds, their importance to the Falkland Islands and the potential impacts of an oil spill plus mitigation steps has been well presented, and are appropriate, with no major issues noted for this review area.	POEPL welcomes the 'A' rating.	
SAMS7	Marine Mammals 'C' The revised chapters concerning the impacts of underwater noise on marine mammals have been improved by the adoption of the NMFS thresholds as part of the assessments made. It was still felt that the severity levels have still been understated, and that they should be elevated from Slight to Minor, resulting in an overall impact significance level of Moderate. However, the project-specific mitigation measures proposed by POEPL are already above and beyond what would be considered routine; essentially they are already aligned towards managing impacts as though they were assessed at the Moderate level rather than Minor. So although such a change is recommended to be documented within the EIS, it is not anticipated that this would result in more work beyond what POEPL has indicated they will be undertaking. There are a number of other	POEPL acknowledges a difference of opinion in terms of classifying the severity of effect, while noting that there is no disagreement over the sensitivities, the quantification of impacts or the mitigation measures that are committed to. POEPL is committed to following the UK Government's official protocol, that has been developed to reduce to negligible levels the potential risk of injury or death to marine mammals in close proximity to piling operations.	

Consultee	Representation	POEPL response	Details in
	recommendations that should be noted, particularly concerning understanding the limitations of types of monitoring devices to be deployed (e.g., PAM). It is likely that this will become more important as discussions on the EMMP progress.		
SAMS8	Seabed sediment & geology 'A' The EIS sections pertaining to geology, seabed sediments and bathymetry were extremely comprehensive, with no major issues noted. Overall this is a robust and highly detailed examination of the impacts and risks associated with hydrocarbon extraction onshore and offshore of the Northern Falkland Islands.	POEPL welcomes the 'A' rating.	
SAMS9	Seabirds 'B' The EIS is a highly detailed technical document that comprehensively covers aspects of seabird biology and ecology of species occurring in Falkland Islands waters. It has widely sourced relevant peer reviewed and grey literature, and in general has displayed an appropriate level of understanding of the sourced literature, and where appropriate applied the findings suitably. The risk assessment section uses appropriate, internationally recognised methodologies for detailing its findings. Some assumptions with regard to seabird distribution around the proposed drilling site are not supported by the data, and are displayed in a somewhat misleading fashion. However, the report is clear on stating these shortcomings where appropriate, and has indicated where the data will be reviewed after ongoing studies are concluded, and where further studies will be undertaken to improve data gaps. Despite the issues with the presentation of the distribution information, the application of seabird distribution information to the risk assessment framework has been appropriate.	POEPL welcomes the 'B' rating. POEPL disagrees that the data are presented in a misleading manner. The Environmental Description Section 7.4.5.2 reviews the available data on seabirds, and other taxa, in sufficient detail to support the assessment sections of the document. In the past, some reviewers commented that the EIS contained too much detail in the Environmental Description and, therefore, efforts were made to pare back this section to provide only the information that was considered to be directly relevant to the assessment. This was intended to make the analysis clearer. References throughout the document direct the reader to the original sources where further detail can be found. POEPL undertook an independent review of these data which is described and referenced in Section 7.4.5.2.1.1.	
SAMS10	Social 'B' The overall assessment and modelling of the technical aspects of the scoping and social impact chapters is strong and the mitigation measures that are suggested are appropriate to the data presented.	POEPL welcomes the 'B' rating.	

Consultee	Representation	POEPL response	Details in
	However, the less technical aspects of social impact chapter are not as strong – the disturbance to other users (onshore) and the resource competition (accommodation) sections, in particular. The use of literature where models or quantifiable data was not available is very limited. It is unclear whether these topics will be covered in the social impact assessment (SIA). Chapters 6 and 11 of the POEPL's Sea Lion Field Development EIS are technically robust, methodologically sound, present the data in a logical fashion, and reach conclusions that are generally evidence-based. There are weaknesses in Chapter 11 in relation to the less technical aspects of some of the social impacts, especially in relation to fishing livelihoods and resource competition for accommodation where it is unclear whether these have been covered by the SIA or not.		
SAMS11	Water quality 'A' The Sea Lion Development - Phase 1 Environmental Impact Statement was assessed on its treatment of impacts to water quality. The various stages of the development from MODU to transfer of oil were covered, by activity. Planned water quality impacts such as suspended particulates from drilling muds to unplanned such as maritime accidents were covered. Activities offshore were examined as well as inshore. Numerous scenarios at different contamination levels and from different sources were covered. The literature was adequate and relevant. The sections on water quality impacts are what one would expect to see in an EIA prepared for the UK oil and gas sector.	POEPL welcomes the 'A' rating.	
SAMS12	Other 'B' The EIS is an extremely comprehensive document, and contains all the sections necessary to allow for a full evaluation of the proposed Sea Lion development. The Project Description is clear, the methodology and approach for the impact assessments is appropriate and uses recognised methods. Some minor alterations to how the assessed 'Severity', 'Sensitivity' and 'Impact' evaluations	POEPL welcomes the 'B' rating.	

Consultee	Representation	POEPL response	Details in
	are written would add some clarity to how the methodology has been applied. The organisation of the document is logical, and Chapter layout is consistent. There are some minor typographical and formatting errors, which is unsurprising considering the size of the whole document.		
SAMS13	4.1.2 Table 3.1 provides a clear summary of the environmental monitoring commitments that POEPL intend to undertake during the lifetime of the Sea Lion Phase 1 development. The planned monitoring to adhere to legislative and corporate requirements (Tables 3.2 and 3.3) are realistic and achievable commitments, based on POEPL's existing environmental monitoring programmes established at other developments. The scope of these proposed monitoring programmes also appears to be appropriate for the proposed development.	POEPL acknowledges the comment.	
SAMS14	4.1.3 With respect to the seven impacts highlighted after the EIA process for monitoring due to either uncertainty of impacts or sensitivity of receptor, the proposed monitoring programmes appear to be appropriate and realistic. Where the EMMP is currently lacking is in defining 'expected' or 'predicted' results, against which the adaptive management thresholds can be applied. As an example, Table 3.5.1.2 Benthic Sediments, has adaptive management thresholds that read 'Resample – a significant fraction of the samples are outwith 1 SD of expected results'; 'React – Impacted areas are >100% greater than expected'. Whilst these thresholds appear to be appropriate, no information is given within the EMMP as to what 'expected results' are. It is expected that such detail will be forthcoming at a later date as the development progress towards the sanction stage.	POEPL agrees that the determinands and thresholds that will be implemented in the EMMP will be developed in further detail, while the details already provided are those that were the outputs of multi-stakeholder discussions at the EMMP workshop in April 2019.	
SAMS15	4.1.4 Within the EMMP, there are several references to 'periodic reviews' (i.e., 'periodic reviews on whether or not impacts of waste remains ALARP'; '… all impact and risk assessments will be periodically reviewed to ensure controls remain in place…'). In these cases, there is no indication as to the timeframe that maybe covered	The EIS (Section 15.3.2) commits to a formal review of the EMMP at least every 5 years. More details of expected EMMP review timescales and governance are included in the	

Consultee	Representation	POEPL response	Details in
	by the term 'periodic', which may vary considerably depending on the item in question. In Section 3.2 'periodic' is defined as 'At least every five years', which seems sensible for review of the EMMP document. However, this timescale seems too long for waste management review. It is suggested that some caveats are included alongside the use of 'periodic' for clarity.	EMMP document which was made available during the consultation period.	
SAMS16	4.1.5 There is an intention to investigate Loligo squid spawning grounds to fill a data gap. In Section 3.5 it is stated that POEPL will co-operate 'with surveys relating to Loligo spawning grounds within Berkeley Sound environs prior to operations'; this is reflected in Table 3.6 with a planned baseline survey at the sanction stage. Whilst it is recognised that the EMMP will be adjusted as data becomes available from all monitoring programmes, it is felt that a more explicit reference to possible ongoing monitoring pending the results of the baseline surveys could be included for this particular receptor.	This topic has been progressed with support from POEPL including initial test deployments of an ROV. It is too early to report any results but the EIS has been updated to more clearly state the aim of undertaking spatial / bathymetric surveys and habitat characterisation of squid (loligo) spawning grounds.	Section 7.2.4.1 and 15.5 updated.
SAMS17	4.1.6 With regards to the monitoring proposed in Section 3.5.1.3 for potential impacts of underwater noise on marine mammals, the recommendations made in Wittich *et al.* (2018) should be taken into account with regards to the design of monitoring arrays. As stated within that report, the use of PAM is an appropriate tool, but there must be awareness shown of the limitations of the system so that ultimately the effectiveness of the intended monitoring can be judged. It is accepted that detailed monitoring plans are not included within the EMMP at this stage, and that this work may be ongoing.	POEPL agrees with this comment and will incorporate this recent information on monitoring design, and an acknowledgement of the limitations of PAM, in the EMMP.	
SAMS18	4.2.1 All recommendations made here acknowledge that the EMMP will not yet be fully detailed until the project gets closer to the sanction phase, and that the new environmental legislation proposed by the FIG is not yet in force. However, there are some pertinent points to be noted. The following sections examine each point of the 'Content of Environment Plans', and whether the	POEPL acknowledges the comment.	

Consultee	Representation	POEPL response	Details in
	current EMMP demonstrates compliance. A summary of the sections below is included in Table 2.		
SAMS19	4.2.2 Under point (a) of the 'Content of Environment Plans' proposed by the FIG, an Environmental Plan (EP) must 'set environmental performance standards'. This point stands out as the hardest for a developer to adhere to when drafting an EP, as it requires some metric or threshold for impacts to be defined. Whilst the Sea Lion EMMP states that it '…will also identify the thresholds…' (Section 3.1, pg. 12) and details that defining and agreeing 'intervention thresholds' was a key aim of the EMMP workshop held in 2019, there appears to be no definite statement of these thresholds within the EMMP document. A specific example is outlined in Section 4.1.3 above. It is acknowledged that this omission is likely due to such metrics not yet being defined. A requirement for baseline data to define pre-development conditions would be necessary to set such thresholds, and the EMMP shows that such surveys are not planned to be completed until the post-sanction phase of the project.	POEPL welcomes this input on the potential interface between existing processes for EIA under the Offshore Minerals Ordinance and future legislation and looks forward to commenting on draft future legislation when this is published, along with refining the EMMP.	
SAMS20	4.2.3 Considering the above, the timing of baseline data acquisition in Table 3.6 seems to be phased slightly late for benthic sediments, seabirds –light and –oil spill, marine mammals –collision and –noise. The Reviewer would have expected such activities to commence on sanction/FIG approval, rather than at FPSO Construction etc., as activities undertaken during this phase may alter the results of baseline data acquisition.	For almost all topics in the EMMP, there is sufficient baseline data to commence the monitoring phase. For some, additional baseline data is required and will be fed in. This includes data on the actual noise outputs of offshore and inshore sources, and on the deposition of drill cuttings, which can only take place once operations are ongoing. This can be clarified in the EMMP document.	
SAMS21	4.2.4 As the EMMP does not adhere to point (a) of the 'Content of Environmental Plans', there is a knock-on effect on whether there is sufficient information to address points (b), (e) and (h) – without set environmental performance standards, it is not possible to fully define outcomes against which performance can be measured, expected performance levels in respect of each performance	As above, POEPL is operating within the current Offshore Minerals Ordinance process and guidelines. POEPL will review the alignment of the EMMP with a proposed 'Environmental Plan' when it has sight of the legislative proposals. POEPL appreciates this feedback,	

Consultee	Representation	POEPL response	Details in
	standard, and thus report compliance to those standards. However, within Table 3.3 the EMMP details legislative and corporate environmental monitoring requirements, which does state limits on what is an acceptable level for some impacts, along with the monitoring programme designed to measure these levels. Adaptive management thresholds defined in Section 3.5 show that actions will be taken if monitoring results fall outside a defined criteria, although the thresholds for action require an acceptable base level to be set. These areas show that POEPL have taken steps to define performance levels and outcomes, but they may need to be amended once environmental performance standards have been set.	which no doubt will be considered fully in the future.	
SAMS22	4.2.5 Table 3.2 demonstrates that POEPL have a comprehensive monitoring plan for environmental KPIs, detailing the areas monitored, the frequency and units of measurement. However, there are no metrics provided within this table as to what are regarded as acceptable levels for these KPIs. It may be that such values cannot be established or be stated with any certainty at the current stage of the development. Together with Table 3.3, and the information provided in the Tables within Section 3.5, the EMMP shows that there are arrangements for the monitoring and recording of performance (including pollution discharges), which meets the criteria for points (h) and (i). As detailed in Section 4.2.4 above, without set performance standards, reporting compliance as required in point (h) is not possible, but should be easily achieved within the framework of reporting outlined in the EMMP once thresholds are defined.	POEPL is operating within the current Offshore Minerals Ordinance process and guidelines. POEPL will review the alignment of the EMMP with a proposed 'Environmental Plan' when it has sight of the legislative proposals, and POEPL appreciates this feedback which no doubt will be considered fully in the future.	
SAMS23	4.2.6 Sections 3.2, 3.3 and 3.4 define the systems, policies and procedures that that will be employed to monitor for any potential environmental impacts arising from the development, and how that information will be used to inform changes to reduce impacts or maintain them at ALARP levels. The EMMP adheres to points (c) and	POEPL appreciates this feedback on the EMMP.	

Consultee	Representation	POEPL response	Details in
	(d) of the 'Content of Environment Plans' as far as is practically possible at this stage of the development.		
SAMS24	4.2.7 Section 3.4 describes POEPL's Corporate Health, Safety, Environment and Security Policy Management System (HSES-MS), and how the Sea Lion development fits within that structure. It defines the chain of command and roles and responsibilities and project-specific management plans. Section 3.4.3 defines how the Sea Lion Development will be audited to check compliance, whilst Section 3.4.4 describes contractor management, and Section 3.4.5 details management of change for the project. These sections cover the points (f) and (g) of the 'Content of Environmental Plans'. There could perhaps be additional detail in defining specific named roles and responsibilities for the management of the development, including a more detailed organogram, and it is noted on page 2 that once the project has been sanctioned, the EMMP will become a live document with these details included.	The EMMP will indeed be populated with more organisational data as this becomes known post-Sanction.	
SAMS25	4.2.8 Point (j) requires that an EP must 'include arrangements for third-party verification of the responsible person's compliance with performance standards'. Although an overview of auditing is provided in Section 3.4.3, there are no explicit details of how the monitoring records will be verified by independent parties. The EMMP does state that the results of monitoring relating to the seven impacts where uncertainty remains and ongoing research studies will be reported to the FIG (Sections 3.5.1.1 to 3.6.3.4). It is felt that the EMMP could benefit from an additional section where a description of how independent checks on the commitments made within the EMMP will be carried out. This also applies to the content of point (l); whilst the EMMP states that regular reports on environmental performance will be made to the FIG, the arrangements for doing so (including frequency) are not explicitly defined.	POEPL envisages that the EMMP governance will provide a robust level of checking and challenge and will include participants who regard themselves as independent. POEPL submits that the governance panel may consider itself an appropriate body to decide whether further review is needed by external parties.	
SAMS26	4.2.9 There is no explicit list on the types of events that would constitute reportable events, as required by point (k). It is clear that	POEPL appreciates this feedback on how governance may be effective.	

Consultee	Representation	POEPL response	Details in
	performance against environmental KPIs will be reported, and results of monitoring programmes provided, but no details are included to describe how those areas outwith acceptable thresholds will be highlighted. Introducing an explicit mechanism on reporting by exception may offer a sensible way to flag these events. Whilst management actions and adaptive management thresholds are provided (Tables within Section 3.5), there is no reference to how they will be reported.		
SAMS27	4.2.10 The 'Content of Environmental Plans' is a document that is being drafted as part of new environmental legislation by the FIG. To demonstrate compliance against this document, it may be advisable that the content of the EMMP be re-arranged to more explicitly show that the points have been adhered to. In particular, diagrams showing (more detailed) organisational structure, roles, responsibilities and reporting mechanisms will add a level of clarity that is currently absent, and it appears that POEPL intend to include such content once the project is sanctioned. As it currently stands, the main deficiency of the EMMP is the lack of defined environmental performance standards, which undoubtedly reflects the current stage of the development, and is thus understandable. There is an opportunity to define a reporting by exception system, which would aid POEPL in showing compliance to many of points required under the new legislation.	As above, POEPL is operating within the current Offshore Minerals Ordinance process and guidelines. POEPL will review the alignment of the EMMP with a proposed 'Environmental Plan' when the proposals are published, and appreciates this feedback which will be considered fully in the future.	
SAMS28	TABLE OF COMPLIANCE OF EMMP WITH PROPOSED ENVIRONMENTAL PLAN	POEPL acknowledges this as summarising the preceding points and for future reference.	
SAMS29	5.1.1 In lieu of a complete Oil Pollution Emergency Plans (OPEP) for the Sea Lion Development, FIG provided three documents for SRSL to review: • Oil Spill Response Strategy for Inshore Operations FK-SL-PMO-EV-STY-003 -B01 • Oil Spill Strategy for Offshore Operations FK-SL-PMO-EV-STY-0007 - B01 • Oil Spill Strategy for Stanley Harbour FK-SL-PMO-EV-STY-0008 -	POEPL acknowledges the comment.	

Consultee	Representation	POEPL response	Details in
	B01 5.1.2 The information contained within the three documents mirrors that included within the version B04 of the EIS, principally Chapter 12: Accidental & Chronic Oil Pollution. 5.1.3 The oil spill strategies outlined within the documents appear to be reasonable and appropriate, with management plans and oil spill response strategies that tally with the commitments made within the EIS.		
SAMS30	5.2.1 As with the EMMP, all recommendations made here acknowledge that a final OPEP will not be submitted until more detail is available, which will be once the Safety Case has been accepted, and that the new environmental legislation proposed by the FIG is not yet in force. Each of the three documents under review explicitly state that it is not an OPEP, but an overall strategy, which is an important consideration when identifying areas where information is lacking. The following sections examine each point of the 'Requirements for Oil Pollution Emergency Plans' proposed by the FIG, and whether the current oil spill strategy documents demonstrate compliance. A summary of compliance to the new legislation is included in Table 3 below.	POEPL acknowledges the comment.	
SAMS31	5.2.2 Point (1) of the 'Requirements for Oil Pollution Emergency Plans' states that 'An OPEP must take into account any risk assessment undertaken during the preparation of the safety case'. The Reviewer has not had sight of the safety case, but is aware that it is has yet to be accepted. It is not possible to know whether the risk assessments made have been incorporated into the oil spill strategy documents, and considering the current point of progress with the safety case, explicit references within the oil spill strategy documents to the risk assessments are unlikely to be included anyway.	POEPL has not had sight of proposed requirements for OPEPs under the expected Environmental Case Regulations. POEPL's oil spill response plans have been developed in line with UK requirements and prevailing Falkland Islands guidance for exploration wells. The OPEP must reflect the outcomes of the Safety Case where oil spill response is identified as being within the envelope of safety and environmental critical elements. Work on safety in design, and the Safety Case Design Notification, has proceeded in parallel with the EIS and the Oil Spill Strategies. Draft OPEPs are	

Consultee	Representation	POEPL response	Details in
		in preparation and POEPL looks forward to developing its plans in discussion with the authorities.	
SAMS32	5.2.3 Section 8 within the offshore operations and Section 9 within the inshore operations document defines the POEPL incident command structure for the Sea Lion development. It is stated that 'A detailed management structure with roles and responsibilities will be defined in an OPEP/OSCP to be prepared closer to operations'. The lack of this information means that points (2a) and (2b) within the FIG proposed requirements are currently not met, although there is every indication that they will be in the future. The oil spill strategy document for Stanley Harbour has Incident Management covered in Section 10, again with the caveat that a detailed management structure is to follow closer to the commencement of operations.	POEPL would note that it is not in possession of proposed requirements for OPEPs under the expected Environmental Case Regulations. More detailed arrangements will be included in operational OPEPs closer to operations.	
SAMS33	5.2.4 Section 12 Training and Exercises within the Stanley Harbour document details the training requirements for all personnel (both POEPL and contractor) involved with bunkering operations that would be required to act in event of a spill, in addition to summarising the training exercises undertaken to keep skills up to date. Similar details are provided within Section 8.2 of the offshore operations document, and Section 9.2 of the inshore operations. The tables provided within these sections adhere to the requirements under point (2c), although no reference is made to co-ordinating the training with the Falkland Islands Contingency plan, which is specifically detailed as a requirement.	As above	
SAMS34	5.2.5 Each of the oil spill strategy documents have defined specific scenarios in order to assess potential worse case release of oil to the sea. For the inshore operations, three scenarios are defined in Section 3.1: • A 10 tonne Marine Gas Oil (MGO) spill resulting from a bunkering incident • A spill of 3,400 tonnes of MGO due to installation vessel collision	POEPL acknowledges this point; the likelihood of simultaneous worst-case events is extremely small, and it is not an expectation in the UK (or other countries to our knowledge) that such scenarios are specifically documented or planned for.	

Consultee	Representation	POEPL response	Details in
	with a third-party • A spill of 1,500 tonnes of Intermediate Fuel Oil (IFO) due to drift grounding Sections 3.2 and 3.3, detail the modelling methodology used to assess the scenarios, and assumptions overlying the discharge analysis. The results of modelling the consequences of each scenario are included within Section 3.4. The offshore strategy document follows a similar structure, with two scenarios detailed and modelled in Sections 3.1 – 3.4: • A subsea well blowout during the drilling stage • Full inventory loss from the FPSO, and two CTT tanks. The Stanley Harbour document follows a slightly different structure, with likely spill scenarios defined in Section 2. A description of the likely fate resulting from such spills is included within Section 3. The Reviewer believes sufficient information is contained within the three documents to adhere to point (2d), although it is noted that there is no current attempt at assessing the consequence if scenarios from each document were to happen concurrently.		
SAMS35	5.2.6 Point (2e) requires that the OPEP contains arrangements for limiting risk to the environment, including descriptions of equipment and how warnings are to be given and action taken. The inshore operations and offshore operations have a section entitled 'Response Options' (Sections 5 and 4 respectively) that details the process of choosing an optimum response strategy. These sections include descriptions of how to contain, recover or disperse a spill in order to limit risks to the environment in the event of an accident occurring. Both documents also have an 'Oil Spill Response Equipment' section (Section 7 for inshore, Section 6 for offshore), which describes the equipment to be used in event of a spill. Preventative measures are included in Appendix 2 and 4 of the inshore and offshore documents respectively. Appendix 7 in the offshore and Appendix 5 in the inshore operation document contains a flow chart detailing the response strategy. The flowchart	Operational details and specific reporting structures will be included in the operational OPEPs in due course.	

Consultee	Representation	POEPL response	Details in
	shows a clear decision tree as to what steps should be initiated in response to an oil spill event, but does not define who is responsible for initiating the emergency procedures or for making the decisions at each stage gate. It is assumed that when the management structure is defined, these flow charts will be updated (as discussed in Section 5.2.3 above). The Stanley Harbour document includes Section 5: Prevention, Section 6: Response Options and Section 9: Tactical Response Plans, with equipment listed within Section 11. One item that does not appear to be explicitly stated within any document is 'how warnings are to be given', which is a specifically detailed requirement in the FIG document.		
SAMS36	5.2.7 Point (2f) requires more specific information on equipment and resources available to respond to an event. As described above, descriptions of equipment are included in each document. For the Stanley Harbour strategy document Table 11.1 is the sole source of information. Appendix 8 of the offshore document includes a detailed inventory of oil spill response assets, with a similar account within Appendix 6 of the inshore operations document. Point (2f ii) requires that storage locations for equipment are provided, along with details of ownership, and the arrangements for transport and mode of deployment at an incident site. Whilst storage locations are included in all documents, the other required items are not explicitly detailed.	Details of storage arrangements and ownership will be included in the operational OPEPs in due course. POEPL would note that oil spill response resources have previously been located and operated in the Falkland Islands during exploration well campaigns.	
SAMS37	5.2.8 Within the three oil spill strategy documents, there no explicit details provided on measures that will ensure response equipment and procedures are maintained in an operable condition, as required by point (2g). However, the scheduled training exercises (see Section 5.2.4 above) would likely test the oil spill response procedures on a regular basis.	Specific operational details will be included in the operational OPEPs in due course.	
SAMS38	5.2.9 Point (2h) requires that an OPEP must include an estimate of the oil spill response effectiveness, taking into account various environmental factors. The inshore and offshore strategy documents both use the Oil Spill Contingency and Response (OSCAR)	POEPL infers that the details provided in the EIS and supporting strategies are therefore acceptable, with a residual question around spill response effectiveness in Stanley Harbour.	

Consultee	Representation	POEPL response	Details in
	model to examine the effectiveness of the proposed response. The modelling is detailed in the section 'Effectiveness Assessment', and is supported by a short appendix describing the OSCAR model. Within the inshore document, these are Section 10 and Appendix 1, whilst they can be found in Section 9 and Appendix 3 of the offshore document. The OSCAR model takes into account the environmental variables detailed as a requirement, although the content relating explicitly to this is found within the main EIS document, and not within the strategy plans themselves. The inshore document does also include notes on additional environmental information pertaining to Metocean conditions in Appendix 3. The Stanley Harbour document does not include any assessment of effectiveness to the proposed oil spill response measures.	This has been described in a different way to the offshore and inshore scenarios due to the scale of the likely releases. Section 12.3.7 discusses the effectiveness of at-shore response options and recognises that prevention is the main tool.	
SAMS39	5.2.10 Point (2h) requires that evidence of prior assessment of any chemical dispersants have been carried out. Each document discusses the possible use of dispersants, and conclude that dispersant use is not a primary response option. Within the Stanley Harbour document, Section 6.6 states 'dispersant application for oil spills in Stanley Harbour is not considered a viable response strategy', whilst Sections 4.2.4 and 5.3.1 from the offshore and inshore documents state '… POEPL will not store any dispersants in the Falklands and will rely on access to dispersants *via* Tier 3 oil spill response provider OSRL in the unlikely event that an IFO oil spill occurs…'. It seems reasonable that no further information has been provided considering POEPL's intent not to use chemical dispersants.	POEPL acknowledges the comment.	
SAMS40	5.2.11 Point (2j) requires that an OPEP has information on the potential effects resulting from a spill, and how these may be mitigated. This appears to be outwith the scope of the strategy documents, as this information is included within the main EIS document. However, the documents do contain an Oiled Wildlife Response Strategy (Section 8 & Appendix 7 inshore, Section 7 & Appendix 9 offshore and Port Stanley), which includes information	POEPL believes the information provided is appropriate for the purposes of the EIS. Further details of wildlife response and waste management will be included in the operational OPEPs in due course.	

Consultee	Representation	POEPL response	Details in
	how impacts to wildlife receptors would be handled and monitored. Each document also has a section on Waste Management (Section 6 inshore, Section 5 offshore and Section 8 Port Stanley), which details how waste generated from a spill will be dealt with. Shoreline Response information is also provided (Appendix 4 inshore, Appendix 6 offshore), detailing how Shoreline Clean-up Assessment Technique (SCAT) teams will be deployed in event of a spill. Whilst these Sections do not cover the entire required content of point (2j), they demonstrate some of the required information.		
SAMS41	5.2.12 No information within any of the strategy documents could be found pertaining to the arrangements for providing an early warning of a major environmental incident, as per point (2k) and sub-points therein. It is likely that such information will be included in the final OPEP closer to the commencement of operations.	This requirement is not one POEPL is currently aware of. There are many measures in place for early warning, and POEPL would expect to include these in operational OPEPs, and in line with any new requirements in the future.	
SAMS42	5.2.13 Taken as a representative of what the OPEP for the Sea Lion Development may contain, the three oil spill strategy documents generally showed a great deal of compliance with the proposed 'Requirements for Oil Pollution Emergency Plans' as drafted by the FIG. Where gaps exist, this information is likely lacking due to the current phase of the development, and will likely be provided in due course. Point (2j) appears to require that the OPEP includes information that is undertaken principally as part of the EIS for the development; the Reviewer wonders whether this should be a stated requirement of OPEPs, or whether reference to the EIS would be sufficient.	POEPL welcomes the comment regarding the content of the Oil Spill Strategies. POEPL would prefer any future approaches to documentation to minimise duplication while keeping necessary data accessible in an emergency.	
SAMS43	5.2.14 As mentioned for the EMMP, to demonstrate compliance against the new legislation being proposed by the FIG, it may advisable that the content of the OPEP be re-arranged to more explicitly show that the points have been adhered to.	As above.	
SAMS44	TABLE OF COMPLIANCE WITH PROPOSED OPEP GUIDANCE	POEPL acknowledges this as summarising the preceding points and for future reference.	

Consultee	Representation	POEPL response	Details in
Joint Nature Conservation Committee (JNCC)			
JNCC1	We note previous advice regarding marine mammal injury thresholds has been followed and the marine mammal noise assessment has been updated to take account of updates to the thresholds. Page 708, Section 10.4.4.3.4.4; The EIS states disturbance thresholds in Southall 2007 are unchanged by NMFS 2016. While strictly true, we highlight that NMFS 2016 only discusses injury and parameters to assess disturbance, these are currently under review by NMFS. We also highlight that contributors to NMFS 2016 have published the same injury thresholds in a peer-reviewed journal (Southall *et al.,* 2019). While the thresholds/functions presented in each document are identical, the terminology used to identify the hearing function groups does differ between the two documents: e.g., high frequency in NMSF 2016 is very high frequency in Southall *et al.,* 2019. When undertaking future noise assessment, applicants should be clear with regard to which reference they are using.	POEPL acknowledges these points and will take these into account for any future work.	
JNCC2	The noise assessment appears to have used the Sound Pressure Level (SPL) metric for predicting injury and cumulative Sound Exposure Levels (SELcum) for predicting behaviour. We highlight that both metrics are recommended when assessing potential injury from impulsive noise. For disturbance, we favour the use of a fixed deterrent range based on empirical evidence as opposed to disturbance ranges estimated from noise modelling. The latter carries considerable uncertainty. In particular: there are no agreed quantitative thresholds for disturbance as there are for auditory injury; depending on the choice of numerical models to estimate sound source and propagation, one can end up with several orders of magnitude different predictions for disturbance ranges; received sound levels are not the single most influencing factor in triggering disturbance, other characteristics of sound and how they propagate with distance will influence how an animal perceives the noise; and behavioural context, individual animal motivation and previous	POEPL understands the concerns and points out that the use of a disturbance threshold is referenced and there is no published guidance to use a fixed deterrent range. POEPL acknowledge the uncertainty in assessing the impacts of underwater noise in the uncertainties section in Section 10.4 (graded 'Uncertain'), which forms part of the precautionary assessment. Nevertheless, POEPL appreciates the input and a precautionary deterrent range has been included in the text of EIS. It is noted that the disturbance ranges calculated for Scenarios 1 and 2 in Section 10.3 are 17.5 km and 21.5 km respectively, which is a similar scale to the ranges quoted by JNCC for activities similar to	Section 10.4.4.4.4.3 of the EIS updated.

Consultee	Representation	POEPL response	Details in
	exposure will also all play a role in determining response. For pin piling (smaller diameter piles that secure jacket structures), one study found a 50% probability of porpoise response within 7.4 km, in the 12 hours after the piling had ended (the deterrence distance during piling was not reported). The study also showed a 25% probability of response within approximately 18 km. Potential habituation was also recorded, with response distances decreasing over the duration of the piling operations (Graham *et al.,* 2019). For this type of piling we recommend a precautionary 15km deterrence range to be used in assessments. Conductor piles used in oil and gas well surface holes have also much smaller diameters (<1m) therefore requiring lower hammer energy than for monopiles and generating noise of a lower amplitude (Jiang *et al.,* 2015, MacGillivray 2018). We recommend a precautionary 15km effective deterrent range (EDR).	Scenario 1. Since Scenario 1 is a shorter duration activity than Scenarios 2 and 3, POEPL is confident that the overall assessment rating of offshore underwater noise is not increased by taking this approach.	
JNCC3	The noise modelling report states a range of swimming speeds has been modelled (page 22), however, page 32 states a swim speed of 5m/s has been used as 'typical' of cetacean swimming speed and conservative, as escape speeds would be higher. We believe, in reality, this is likely to be slower. For example, Mate & Stafford 1994 (white-sided dolphins), Bloch *et al.,* 2003 (pilot whales), Goldbogen *et al.,* 2006 (fin whales) all recorded slower average speeds from tagged animals. In addition, there is no evidence animals would sprint away from a noise source. Subsequently the injury ranges may be larger than predicted and therefore a precautionary approach is advised when considering mitigations zones.	POEPL acknowledges this point and would note that the 5 m/s swim speed was a common (and referenced) assumption at the time the original assessment was undertaken. Actual swim speeds are very variable, especially if the animal is considered to be 'fleeing'. It is acknowledged that swim speeds of around 2-3 m/s are quoted in literature, with several recent papers contributing to this knowledge. A re-analysis of the predicted sound exposure levels during the conductor piling operations has been undertaken using a swim speed of 2 m/s, which acts to increase predicted levels. At the same time however, the application of a 'soft start' to the operation has been incorporated into the analysis, whereby hammer energy is increased gradually over a period of 20 minutes. This acts to decrease	Section 10.4.5.1 updated.

Consultee	Representation	POEPL response	Details in
		predicted levels. The results of these updates together mean that the sound exposure levels are no greater than those quoted in the EIS. On balance therefore, the assessment conclusions are unchanged.	
JNCC4	Piling We commend POEPL on their intention to follow JNCC mitigation guidelines for use during piling should it be required. However, we note that the revised modelling predicts injury to high frequency cetaceans could occur at 850m from the source. We subsequently recommend that the mitigation zone is increased from the standard 500m to 1km. We repeat our previous advice that the pre-piling search is undertaken for 60 minutes to allow for the possibility of deep-diving species in the area. We recommend use of the guidelines are included as a condition of any consent issued and note a commitment by the applicant to provide FIG the Marine Mammal Observer (MMO) reports once piling is complete. This report will provide evidence of compliance and may provide additional insight into marine mammal presence in the area.	The EIS has been updated to reflect a recalculated mitigation zone of 700 m taking into account a revised swim speed assumption of 2 m/s and the inclusion of a soft-start top the piling operation. The EIS also commits to a 60 minute pre-piling search as recommended by JNCC. Under ideal conditions, it should be possible to visually detect hourglass dolphins (the most numerous high frequency cetacean in the area) at this range. However, detectability will be lower with increased sea state or reduced visibility at increasing distance from the observer. POEPL has already committed to using PAM to help in the detection of HF cetaceans as an additional precaution.	Section 10.4.5.1 updated.
JNCC5	Explosive use We note that explosives will be used to perforate the well once drilled. As this will occur between 1.8 and 2.2km below the seabed, marine mammal mitigation will not be required before this operation.	POEPL acknowledges these points and will take these into account for any future work.	
JNCC6	Monitoring Page 1446, Section 15; We appreciate that monitoring plans included within the EIS are drafts and specific protocols are still to be developed, however the information presented felt confused. The purpose of the monitoring proposed is not clear (i.e., what questions are to be answered), and there appears to be overlap between mitigation and monitoring. For example, Section 15.6.1.3, Post-sanction, pre First-Oil, reads more like mitigation than	The EIS has been amended to clarify that the intended mitigation measures during piling, of having marine mammal observers and PAM, will also contribute to baseline information. Having observers who are SMMOs is established practice and we acknowledge that the specific protocols that they will be expected to follow will be discussed with JNCC in further	Section 15.6.1.3 amended.

Consultee	Representation	POEPL response	Details in
	baseline/ongoing monitoring, further compounded by the task to determine if JNCC piling guidelines need to be adapted. The two procedures need to be considered separately and all mitigation requirements should be detailed in a separate document. It is not clear whether PAM will be used for mitigation, monitoring or both. We also question the intention to have seabird observers contributing to marine mammal data. Again, it is unclear if this is to be part of mitigation searches or monitoring, and the purpose will influence the relevance/appropriateness of such data. We are available to review future drafts and protocols should it be required.	development of the EMMP, and we welcome the opportunity to liaise with JNCC on this.	
JNCC7	Page 46, Table 1.3 and Page 552, Table 7.57; The document states that "However, none of the species found are rare or protected under any Falkland Islands legislation". Although this statement may be true, this does not mean that areas of conservation interest may not still be present in the area (noting that work is ongoing in the Falklands to identify marine areas that support important aggregations of seabirds and other fauna) and therefore a precautionary approach should be taken.	POEPL believes a precautionary approach has been taken with the EIS and the statement is a matter of fact. The EIS provides a lot of data on the existing habitat types from many sources and these have been taken into account in the impact assessment.	
JNCC8	Page 321, Section 7.4.3.3.1; The bullet points at the top of the page state that only six species were recorded in mud habitat and five species were recorded in fine sand habitat. JNCC considers that these numbers seem extremely low for the area and would ask POEPL to clarify if these are correct within the text by explaining why this might be the case. Were the surveys undertaken only considering epifauna, rather than the addition of infauna? Further information should be included in this section to make this clear.	These were SCUBA surveys and represent epifauna only. POEPL has amended the text to make this clear. The surveys comprise a 20 m belt transect and 0.25 m2 quadrats which were photographed every metre and therefore represent the surface only. The text has been amended to make this clear	Amendment to Section 7.4.3.3.1.
JNCC9	Page 329, Table 7.5; JNCC would like to reiterate that in future applications POEPL use the Latin genus and species name, where possible, to aid identification and prevent confusion between common names of species.	Latin names are mentioned at the first occurrence, and then common names have been used to make the content more accessible to a broad spectrum of readers	
JNCC10	Page 330, Table 7.6; It would be beneficial to include a definition of what is classified as open water within the Berkeley Sound. Is there a depth criterion to this classification? It is unlikely that the benthic	The text in the table has been amended to make this clearer. Open water is defined as the area of water outside of the 'kelp line'.	

Consultee	Representation	POEPL response	Details in
	habitats within the open water are the same throughout the Berkeley Sound, particularly when reviewed against Figures 7.26, 7.28, 7.29, 7.30, 7.43 and 7.44, which show the differences in sand, fines and gravel percentages during the BSL 2015 survey and the habitats mapped in the area. It would be more valuable in future applications to characterise the habitat types based on the benthic habitats present.		
JNCC11	Preliminary Impact Assessment and Screening Page 590, Table 9.2; There are several previous suggestions from JNCC on activities in the offshore ENVID assessment (such as large dropped objects, etc) where we believe some receptors should be assessed in further detail, particularly the benthos or seabed and soil. These have not been updated in this version: we would like to reiterate that we believe these should be included.	POEPL notes that in 2018, JNCC commented that in future assessments, consideration should be given to large dropped objects, cooling water discharges and the presence of oil spill infrastructure. Cooling water has now been included in the assessment (Section 10.7.2.3), and oil spill infrastructure is described in Sections 12.1 and 12.2. During the ENVIID, it was agreed that smaller dropped objects could be scoped out of the EIA, noting that these would be retrieved if possible at the time of the occurrence or shortly thereafter. Certainly any remaining debris will be retrieved at the time of decommissioning. However, at the time of the ENVIID it was also agreed that the risk of impacts from large dropped objects required further investigation and so they were scoped in (Table 9.2, pg. 590). Chapter 10.3 on the 'Disturbance to the seabed / placement and removal of objects' describes the nature of the impacts of placing objects on the seabed and the potential for crushing benthos, and smothering through seabed disturbance. The potential impact of marine growth and the creation of artificial reefs is also	

Consultee	Representation	POEPL response	Details in
		discussed. The impacts of the above are described for the offshore and the inshore locations. These data are then drawn upon for the risk assessment of large dropped objects. While the area-wide surveys indicate homogeneity in the benthic communities, the absence of site-specific offshore benthic surveys and detail on the diversity and abundance of benthic fauna around the offshore locations is acknowledged and factored into the confidence assessment. The impact on soil quality from any leaks is discussed in the spill chapters.	
JNCC12	Habitat Classification Page 333, Table 7.7; The last fieldwork class states 'Sand cobbles and pebbles medium depth'. It is still not clear within the document what is meant by 'medium depth' therefore this should be clarified. Page 341, Section 7.4.3.3.4.2; The application states 'Mussel beds were identified at two stations: 11 and 17, with patchy aggregations observed at four further stations although these are not thought to constitute the dense aggregations that define this habitat type'. JNCC would request that POEPL provide evidence as to why the mussel beds recorded at stations 11 and 17 do not constitute 'mussel bed' habitat? Is this due to densities of the habitat in the area?	The reference to medium depth has been clarified to refer to the subtidal zone. Brachidontes blakeanus were found amongst the Aulacomya atra reefs and were not sound in dense aggregations in the overall structure.	Table 7.6 amended.
JNCC13	Drill cuttings modelling Page 777, Table 10.40; The total seabed footprint of drill cuttings from the main drill centre is included in the drill cuttings modelling section. However, it would be beneficial to include the total seabed footprint of all wells to show the worst-case impact area.	The EIS includes deposition thickness predictions for all the drill centres and concluded that "The depositional thickness at the end of drilling the wells was found to exceed 6.5 mm over an area of up to 0.15 km2". There is an additional analysis of the main drill centre that provides a more sophisticated picture of risk factors and area at	

Consultee	Representation	POEPL response	Details in
		risk, which is associated with a high degree of modelling. Since the main drill centre represents the majority of the area of this risk, the analysis was confined to that area, and it provides conclusions on the importance of oil content in cuttings versus deposition thickness, etc. that are applicable to the other drill centres. POEPL submits that the assessment has sufficient data and are willing to incorporate this as a request for any future assessments.	
JNCC14	General Page 356, Section 7.4.3.3.3; The legend of Figures 7.43 and 7.44 are blurry which makes it difficult to determine which habitats are present in each figure. Also, the size of habitat video/ stills within the map are too small to determine the habitats present, therefore it would be beneficial to include larger versions of these below the map to make them clearer. We recommend that these changes are made during the next update.	The figures in question have now been updated in the EIS and are clearer.	Figures 7.43 and 7.44 updated.
JNCC15	Pages 363-366, Section 7.4.5.2.1.1; This section outlines that the EIS has used the JNCC Seabirds at Sea Team (SAST) surveys as the baseline for information on the spatial and temporal distribution of seabirds in the North Falklands Basis (NFB) – i.e., the development area. It acknowledges that there are limitations to the database (age of data, temporal windows, species covered, methodology used), but still considers it the most comprehensive survey data available. Where possible, information has been supplemented by more recent references/data on a species-by-species basis. In response to earlier queries as to how representative the dataset is, given the type of limitations listed above, POEPL commissioned Genesis to undertake a review of the data to assess its adequacy for the purposes of impact assessment. The Genesis review (2017)	An appendix has been added listing the names (and codes) of the species of bird and marine mammal mentioned in the ES	Appendix 1 added.

Consultee	Representation	POEPL response	Details in
	concluded that the survey methods, the coverage and age of the data were comparable with existing datasets used to inform similar impact assessments undertaken in the UK. The SAST was re-examined to highlight the species recorded in the vicinity of the Sea Lion area so that relative abundance of species could be calculated on a seasonal basis – summary data presented in Table 7.12 (page 364). A suggestion for Table 7.12 would be to include an explanation of the species codes in either the table caption or table footer – it is cumbersome to try and find them in the text; also, would suggest repeating heading rows when a table is split over more than one page. In the previous EIS, JNCC commented on the age of the data and whether it is still representative. We are pleased to see that a review and re-examination of relevant data has been conducted, and are more content now that there is evidence that the SAST is satisfactory for such an impact assessment – although the limitations to this dataset identified in the EIS (p365-366) do need to be taken into consideration when considering the outcomes of the impact assessments. We would also encourage POEPL and/or FIG to continue to update data where/when possible and/or consider repeat or regular surveys of seabirds at sea to enhance monitoring and response to impacts/activities. It is noted that some of the data limitations will be addressed by the GAP project (p366); however, it is believed that this programme has now been completed. Text may need to be amended to a more general statement of how these gaps may be addressed.		
JNCC16	Page 366, Section 7.4.5.2.1.2; It appears that data collected from seabird surveys on seismic vessels have not been incorporated into existing seabird distribution data (SAST) and represented within the OVI context. See our comments to Section 7.4.5.6.1: The seismic survey data should be used, alongside other available seabird distribution data that has been collected since the OVI was developed, as a visual assessment of how representative the OVI	Additional references to the seismic surveys have been added to the EIS.	Section 7.4.5.2.1.1 amended.

Consultee	Representation	POEPL response	Details in
	maps might be if it were to be updated with newer data (and methods).		
JNCC17	Page 367, Table 7.13; The text referencing this table (p366-367) says it should show the IUCN Red Data List threat status, but this information appears to be missing from the table itself.	Reference to IUCN status in Table 7.13 has been removed from the text as it was not thought to be relevant to the data presented in the Table. IUCN status for all species of bird mentioned in the text can now be found in Appendix 1.	Appendix 1 added.
JNCC18	Page 368, Section 7.4.5.2.1.3; The reference Baylis, *et al.,* 2019 (cited elsewhere in document) could be inserted in the last sentence of the first paragraph as an example of ongoing work that has now been published.	POEPL acknowledges this point. The reference to Baylis, *et al.* (2019) has now been inserted.	Section 7.4.5.2.1.3 amended.
JNCC19	Page 394, Section 7.4.5.3; A more recent reference for census work of southern giant petrels on the Falklands is available from the census conducted by Falklands Conservation in 2015-16: Stanworth, A. and Crofts, S. (2017). Population status and trends of Southern Giant Petrels (Macronectes giganteus) in the Falkland Islands. Falklands Conservation.	POEPL acknowledges this point and the text has been amended to incorporate the latest census data. Stanworth and Crofts 2017 has been cited here and the data incorporated where relevant.	Section 7.4.5.3 amended.
JNCC20	Page 394, Section 7.4.5.3.1.1; We welcome the inclusion of the data from the additional Berkeley Sound coastal bird surveys that have been conducted since submission of the previous EIS. Even if only a 'snapshot', this seasonal information is very valuable for baseline information.	POEPL acknowledges this point.	
JNCC21	Page 394, Section 7.4.5.3.1.1; 'Summer 2016' could be deleted from the Section heading.	The text has been amended.	Section 7.4.5.3.1.1 amended.
JNCC22	Page 396, Figures 7.56 and 7.57; What is the difference between the four panels in each figure? This should be included in the description to clarify which survey is in each image and when they were conducted.	Each panel has now been labelled with the season in which the data were collected. The figures with the corresponding season have been amended.	Figures 7.56 and 7.57 amended.
JNCC23	Page 398, Table 7.17; It should be made clear that the numbers in the Spring/Summer/Autumn/Winter/Total columns are the number of birds counted in each of the surveys.	POEPL acknowledges this point and the EIS has been amended to make this clear.	Table 7.17 amended.

Consultee	Representation	POEPL response	Details in
JNCC24	Page 399, Table 7.18; It would be helpful to have the list of species codes explained with the table.	POEPL has included these data. Appendix 1 has been added listing the codes used.	Appendix 1 added.
JNCC25	Page 368, Section 7.4.5.2.1.4; We are pleased to see the incorporation of the GAP project data which has now been more comprehensively analysed since the previous version of the EIS. Detail and methods are satisfactory for inclusion and consideration of distribution of the species included in the study, and for use in subsequent impact and risk assessments – caveats highlighted in relation to limitations notwithstanding. While the information on GAP project data and the tracking work undertaken as part of it is clear, what is less clear is how this distribution data is used (quantitatively or qualitatively) in the assessment of risk, particularly in respect of accidental or chronic oil spills. We recommend that, at the very least, tracking data (e.g., Figure 7.48-7.49) is overlaid with the Seabird Vulnerability Maps presented in Figures 7.69-7.72. Ideally, tracking data alongside the new seabirds at sea data from seabird surveys on seismic vessels are integrated quantitatively in an update to the Falkland Islands OVI to bring it into line with comparable Seabird Oil Sensitivity Index (SOSI) analysis from the UK (see comments on later Section 7.4.5.6.1).	The risk assessment in each section has been fully reviewed by specialists at SAERI in combination with POEPL in the light of both the project updates and the recent environmental data presented. Very few changes were deemed necessary, including the assessment of oil spill risks. Similar to the response to comment JNCC16 (seismic survey seabird data), there are significant difficulties in comparing tracking data with SAST data. Thus far, the tracking data shows presence or absence on a 'summer' or 'winter' basis. Further analysis of the tracking data is required to show the density distribution of birds on a monthly basis, if this is to be used to assess OVI. POEPL anticipates that this sort of analysis will be further investigated going forward. POEPL believes the EIS contains sufficient information for its purposes and takes account of data uncertainties.	
JNCC26	Page 368, Section 7.4.5.2.1.4; As well as referencing Baylis, *et al.* (2019), it would also be useful to reference the related GAP II reports which this data and the Baylis *et al.* (2019) paper is based on. These reports contain more detailed information about the data sources and accessibility, as well as the scripts used for the analyses. Citations would be: 1) Baylis, A.M.M. and Tierney, M. (2018). Analytical methods for establishing marine higher predator movements in Falkland Island waters. Report prepared as part of the GAP Project (Phase II) for the Falkland Islands Offshore	POEPL has updated and amended these references which were instrumental in preparation of the Baylis, *et al.,* 2019 paper.	Section 7.4.5.2.1.4 amended.

	Hydrocarbons Environmental Forum (FIOHEF). South Atlantic Environmental Research Institute, Falkland Islands; 2) Baylis, A.M.M., Tierney, M. and Brickle, P. (2019). Marine higher predator modelling: predicting habitat use for colonies not tracked and identifying areas of high species diversity. Report prepared as part of the GAP Project (Phase II) for the Falkland Islands Offshore Hydrocarbons Environmental Forum (FIOHEF). South Atlantic Environmental Research Institute, Falkland Islands.		
JNCC27	Species specific distribution and abundance IUCN threat categories are referred to throughout the EIA, these should include a date (year) as threat categories are reassessed and might change over time. Where IUCN threat categories have been included (Page 427, Table 7.24), it would also be useful to explain the threat category abbreviations for clarity and completeness.	The status of some species changed during the preparation of the EIS. The document has been reviewed to ensure that all references to IUCN status are correct on the date of issuing of this document. IUCN status of all species checked and updated where necessary and included in Appendix 1.	Various amendments, Appendix 1 added.
JNCC28	Page 377, Section 7.4.5.2.2; It would be useful to include an explanation of how POEPL decided which were the most 'noteworthy' species to be included in Table 7.16.	The species included in Table 7.16 are listed according to their abundance as recorded within the North Falkland Basin by the Seabirds at Sea Team (SAST).	
JNCC29	Page 377, Section 7.4.5.2.2; While the limitations of at-sea distributions of seabird species have been highlighted in the EIS, there is no such consideration to quoted population numbers for the majority of species (breeding on the Falklands) described in this section. Many of the Falklands breeding populations have not been censused in many years, nor are subject to regular surveys, and so figures may be considerably out of date. Good population data is required to accurately assess impacts, and so the lack of updated or verification of the accuracy of existing data should be noted as a limitation in the EIS, and possibly noted as a data gap to be filled.	POEPL acknowledges this point. Text has been added to highlight the lack of population census data and population trends as a data gap.	Section 7.4.5.2.2 amended.
JNCC30	Page 377, black-browed albatross (BBA); Although the EIS quotes the last published figures for the size of the Falklands BBA population (Wolfaardt, 2010), a new figure should be released soon from the island-wise census conducted in 2017. If POEPL wanted to	POEPL appreciates the advice and will monitor this.	

Consultee	Representation	POEPL response	Details in
	include reference to this updated figure, they could approach Falklands Conservation who are conducted the analyses on behalf of FIG. Early indications are that the population is at least stable or possibly increasing.		
JNCC31	Page 379, sooty shearwaters (SSW); The recent, unpublished report by Wakefield *et al.* (2017) contains an updated estimate of the number of breeding pairs of SSW on Kidney Island, plus new tracking data (which was incorporated into the analysis by Baylis, *et al.,* 2019). The new population figure puts the number of breeding pairs at 139,000. The report can be requested from the FIG Policy and Environment Unit. Report reference is: Wakefield, E.D., Clark, T.J., Matthiopoulos, J., Bonnet-Lebrun, A.S., 4, Campioni, L., Catry, P. The population size and fine-scale foraging distribution of Kidney Islands sooty shearwaters – a baseline study, Report to the Falkland Islands Government, 30th September, 2017, University of Glasgow, UK, 40p.	POEPL has added this population estimate and reference to the EIS where appropriate.	Section 7.4.5.2.2 and Table 7.16 amended.
JNCC32	Page 381, southern giant petrels (SGP); a more recent reference for the population size of SGPs on the Falklands is from the census conducted by Falklands Conservation in 2015-16, i.e., Stanworth, A. and Crofts, S. (2017). Population status and trends of southern giant petrels (Macronectes giganteus) in the Falkland Islands. Falklands Conservation. For the South Georgia population, the most recent publication is: Poncet *et al.* (2020). The distribution, abundance, status and global importance of giant petrels breeding at South Georgia. Polar Biology 43(1): 17-34.	POEPL acknowledges this update and has updated the population estimates and references in the EIS where necessary.	Section 7.4.5.2.2 and Table 7.16 amended.
JNCC33	Page 381, Magellanic Penguins; Blockley and Tierney (2017) also provide additional data to that referred to in this section for overwintering movements of Magellanic penguins. Blockley and Tierney (2017) data concurs with that in the EIS but could also be cited to further support the evidence base. This reference is cited elsewhere in the document.	POEPL has re-examined the Blockley and Tierney 2017 reference and has amended the text appropriately in the EIS.	Section 7.4.5.2.2 amended.
JNCC34	Page 383, wandering albatross; There has been some more recent publications on the size of the South Georgia wandering albatross population, than the one currently cited in the EIS. See Poncet *et al.*	POEPL acknowledges this and has updated the population estimates and references in the EIS.	Section 7.4.5.2.2 and Table 7.16 amended.

Consultee	Representation	POEPL response	Details in
	(2017). Recent trends in number of wandering, black-browed and grey-headed albatrosses breeding at South Georgia. Polar Biology 40(7): 1347-1358.		
JNCC35	Page 385, northern giant petrels; There has been some more recent publications on the size of the South Georgia giant petrel populations, than the one currently cited in the EIS: Poncet *et al.* (2020). The distribution, abundance, status and global importance of giant petrels breeding at South Georgia. Polar Biology 43(1): 17-34.	POEPL acknowledges this and has updated the population estimates and references in the EIS.	Section 7.4.5.2.2 and Table 7.16 amended.
JNCC36	Page 384, rockhopper and macaroni Penguins; Blockley and Tierney (2017) also provide additional data to that referred to in this section for overwintering movements of rockhopper penguins, and in particular shows them moving through the Sea Lion field in September/October as they return to the Falklands from their overwintering grounds for the summer breeding season.	POEPL has re-examined the Blockley and Tierney 2017 reference and has amended the text appropriately in the EIS. The reference has been incorporated.	Section 7.4.5.2.2 amended.
JNCC37	Page 386, gentoo penguins; The report Baylis, *et al.* (2019) modelled habitat use for gentoo penguins – why has this not been included in the text and as a figure? This has been included for the other species included in the Baylis, *et al.* (2019) analysis and should therefore be included for the gentoo penguin. Tracking data does show them travelling further offshore than the SAST surveys but concurs that most were in shelf waters of <200m.	The omission of the gentoo penguin map was an oversight. POEPL has added the figure showing the gentoo locations, as well as supporting text, to the EIS.	Section 7.4.5.2.2 amended and Figure 7.57 added.
JNCC38	Page 424, Section 7.4.5.5; A more recent publication on the population numbers of South Georgia black-browed albatross is available and should be included in the last sentence of paragraph one. The reference is: Recent trends in number of wandering, black-browed and grey-headed albatrosses breeding at South Georgia. Polar Biology 40(7): 1347-1358.	POEPL acknowledges this update and has updated the population estimates and references in the EIS.	Section 7.4.5.2.2 and Table 7.16 amended.
JNCC39	Page 405, Section 7.4.5.3.2; • Rockhopper penguin: A reference should be provided for the GAP work referred to in the last paragraph – Blockley and Tierney (2017). In Figure 7.60, it would be beneficial to include in the caption that no rockhoppers were observed in autumn and winter, therefore no	The text does state that few rockhopper penguins were recorded in the autumn and none in the winter. POEPL agrees with the points raised by JNCC and the EIS has been updated accordingly. The issues raised	Section 7.4.5.3.2, Figures 7.61-7.66 amended and Appendix 1 added.

Consultee	Representation	POEPL response	Details in
	maps of this are included. • Rock shags: A reference to the rock shag tracking that is referred to should be provided. In Figure 7.61 the caption is incorrect for this figure; also, not all panels in the figure are correctly referred to. • Imperial shags: In Figure 7.62, the caption is incorrect for this figure; also, not all panels in the figure are correctly referred to. • Magellanic Penguins: In Figure 7.64, the source for this figure should be referenced. • Black-browed albatross: In Figure 7.65, the source for this figure should be referenced. • White-chinned petrels: IUCN threat category should be referenced with a date/year. • Sooty shearwaters: In Figure 7.66, is the source of this data from SAST (as stated in the figure caption), or the GAP programme, as stated in the last paragraph of text on p415? This should be updated to reflect the correct source.	regarding IUCN status have been addressed by the addition of Appendix 1. References for the sources of population data are provided in the footnote. Note that 'FI priority species' are a priority according to FIG and management plans have been proposed for these species.	
JNCC40	Page 388, Table 7.16 and Page 419, Table 7.22; These are very useful summary tables. However, some suggested edits to improve them and/or queries are: • The reference date should be provided for the IUCN threat categories provided; • Provide a reference for where the information for the global population numbers and trends came from; • Breeding cycle – information presented here is not consistent for all species. This would be beneficial if this was consistent across the species; • What is meant by 'FI priority species' – who has decided it is a priority? If discussed previously, refer reader back to relevant section; • Provide a footnote (or include in figure caption) as to what the IUCN threat category abbreviations mean; • Move the key to the relative abundance colour codes to the top of the table.	The tables have been amended accordingly within the EIS.	Table 7.16 and Table 7.22 amended.

Consultee	Representation	POEPL response	Details in
JNCC41	Agreement for the Conservation of Albatrosses and Petrels (ACAP) Page 426, Section 7.4.5.5.2; The number of ACAP listed species needs to be corrected from 30 species to 31.	The text has been amended.	Section 7.4.5.5.2 amended.
JNCC42	Page 426, Section 7.4.5.5.2; It would be beneficial to include that, in addition to the breeding populations of the ACAP listed species of southern giant petrels and white chinned petrels that breed near Berkeley Sound, the Falklands also has 70% of the breeding population of the ACAP-listed black-browed albatrosses, and 40% of southern giant petrels.	The proportion of each species breeding in the Falklands IS stated in EIS Table 7.16 and is supported in the text. However, note that throughout the document, the aim is to avoid repetition. Population estimates have been updated with the latest published numbers.	Section 7.4.5.2.2 amended.
JNCC43	Page 428, Section 7.4.5.6.1; To assess the relative risk of seabirds to oil spill, the analysis done by the SAST in 2001 using the JNCC-developed OVI has been used. The report acknowledges that JNCC has updated this method, which is now called the Seabird Oil Sensitivity Index (SOSI). The Falklands SAST data has not been reanalysed with the SOSI methods – we would question as to why this has not been done.	As per above response to comment JNCC16, and below response to comment JNCC44. POEPL does not feel that SOSI as defioned in the UK is necessarily appropriate in the Falkland Islands, and believes this is a matter for JNCC to lead on.	
JNCC44	Page 428, Section 7.4.5.6.1; It appears that recent seabird distribution data, collected in the Sea Lion region from seismic vessels, have not be incorporated into distribution maps and the OVI method applied. Given the age of the Falklands SAST data and the availability of a more up-to-date OVI method (SOSI) we recommend that an entirely new analysis is conducted to create new seabird density layers and update the Falklands OVI, making use of the latest distribution data available (i.e., incorporating SAST, seismic survey seabird data, and tracking data), although we recognise that methods for incorporating these disparate types of dataset are difficult and time consuming. SOSI differs from OVI in both the methods used to calculate vulnerability scores and the species sensitivity scores themselves. A review of these elements, along with creation of new seabird density layers is a complex process, requiring detailed expertise in Falkland Island seabird species and spatial modelling skills. We recommend that this exercise be undertaken but recognise that this may be beyond the scope of this	POEPL agrees a full OVI/SOSI review and update would be disproportionate in terms of this EIS and would recommend that this is a matter for government/ JNCC to lead on. There are difficulties comparing or combining different datasets, such as those from seismic surveys and tracking data in a way that could be used with the OVI/SOSI methodology, which requires the density of each species (number of birds per km2), in specific areas, in each month of the year. POEPL notes that future EMMP plans include gathering SMMO data from vessels of opportunity. POEPL expects that the methodologies for collecting this data will be finalised in light of discussion on how these	

Consultee	Representation	POEPL response	Details in
	EIS. We propose that as part of this EIS, recent SAST, seismic survey seabird data, and tracking data are presented alongside the OVI maps with a visual (qualitative) assessment, by month, of potential changes to spatial oil spill vulnerability in light of more recent distribution data. And we recommend that the Falkland Islands government seeks to produce an updated seabird oil sensitivity or vulnerability tool making use of recent data and improved methods such as those presented in the JNCC's Seabird Oil Sensitivity Index (SOSI). If it is felt that there is a likelihood of more oil and gas developments being proposed/developed in the region, JNCC can assist in either understanding the requirements, and/or undertaking such work.	different datasets can be synthesised or, at least, presented in a way that is complementary and helpful in decision-making in terms of EIA, monitoring and oil spill planning/response. For now, POEPL believes the EIS contains sufficient data for its purposes.	
JNCC45	Page 622, Section 10.1.1; Useful remarks made in the EIA regarding artificial light and how it might be considered when assessing impact are: • Numerous vessels and offshore installations will be used throughout the three Stages of the Phase 1 Development, each of which requires the use of artificial light, and flaring may be required to clean-up four wells from the Mobile Offshore Drilling Unit (MODU). • Artificial light and flares can affect the natural behaviour of animals in several ways such as disturbance to activity patterns and hormone-regulated processes dictated by the internal clock. A more obvious effect, however, is the attraction of seabirds to man-made light sources and their subsequent disorientation. • There is a growing awareness of the impact that anthropogenic sources of light are having on seabirds (Montevecchi, 2006), although quantitative studies are few in number. • Outside the EIA process for major projects, no legislation is in place in the Falkland Islands to govern the environmental impact of artificial light, although offshore industry guidelines are in place. • It is important to understand during this assessment that mitigation measures will be limited by the need to ensure the use of	POEPL acknowledges this point and understand JNCC's emphasis.	

Consultee	Representation	POEPL response	Details in
	sufficient lighting for safety reasons. Specifically, offshore installations are required to be lit in line with various international and national (Falklands) legislation.		
JNCC46	Page 627, Section 10.1.4.1.3; It is noted in the text that the specific lighting specifications of the MODU and vessels that will be used is not known yet; therefore, assessment of light intensity is based on representative comparisons from operations elsewhere. This should be kept in mind when assessing potential impacts.	POEPL acknowledges this point and the EIS commits to reducing light pollution by design and auditing across all vessels.	
JNCC47	Page 633, Table 10.3; The text and table should reference the date/year of the IUCN Red List threat category that has been used, as assessments are updated (relatively) regularly and categories change. Explanation of the threat category abbreviations used should also be given in the table caption and/or footnote.	POEPL has added Appendix 1 to the EIS to clarify IUCN classifications current at the time of preparation.	Appendix 1 added.
JNCC48	Page 639, Section 10.1.6.2; JNCC queried the assessment of impact being 'Possible' for likelihood of multiple bird strikes for both the Sealion and Berkeley Sound areas. We note that the same ranking has been assigned in the revised EIS, and our query remains – i.e., we note the evidence presented in Table 10.4 (Page 636) on bird strikes reported during the 2015 POEPL Exploration Drilling Campaign, which does indicate a level of both bird strikes and mortality associated with it. However, these incidents are all single individual strikes, and would seem to give no supporting indication as to the likelihood (or otherwise) of multiple bird strike incidents. From a precautionary standpoint, it would seem reasonable to allow for the possibility of there being at least one incident of multiple bird-strike events in a year. Adequate monitoring and reporting (of which we note, and welcome, is planned *via* the EMMP) of such incidences as development continues will provide important contextual information as to the likelihood or not of such multiple bird-strike events happening on an annual (or less frequent) basis. Moreover, on the provision of monitoring data regarding such incidences, a more informed examination of the likelihood of impact on particular species can be made. We would note that if multiple	It is impossible to prove that annual multiple bird strike events will not occur. Nevertheless, POEPL does not have any evidence that this is likely on an ongoing basis, and there are other light-emitting marine activities in the area that provide opportunity. Hence the risks are recognised, but it is considered over-precautionary to rate it higher than 'possible'. Section 10.1 states that there are a number of variables that influence the likelihood of bird strikes. The most significant of these is location, and the presence of seabird assemblages close to a source of light. The incident described in Black (2005) occurred off the south coast of South Georgia, which has many differences compared to the North Falkland Basin. From what is known about bird strikes in the South Atlantic, POEPL believes a likelihood of	

Consultee	Representation	POEPL response	Details in
	bird-strikes were observed to occur, then the likelihood or not of potential impact at a population level is entirely dependent on the scale of the incident (and therefore further data is required before anything conclusive can be stated). A previous incident of vessel lighting-induced mortality of Southern Ocean seabirds reported 900 birds impacted on a single night (Black 2005). We welcome the acknowledgment made that, due to the number of variables that influence the potential for bird-strikes, it can be challenging to assess the risk of bird strikes due to artificial lights, and the recognition that there is a need to identify opportunities for improvement through mitigation and controls, and to consult with project stakeholders further on this topic.	'Possible' for multiple bird strikes is appropriate.	
JNCC49	Page 642, Section 10.1.7; Recognising that ensuring a safe working environment and the need to adhere to international and national legislations limits any additional project-specific mitigation measures that can be put in place to reduce impacts by artificial lights on seabirds, those outlined in 10.1.7 appear satisfactory. It is welcomed that monitoring of light-related impacts forms a part of the EMMP and further mitigation will be discussed should adverse impacts be identified.	POEPL appreciates the point made.	
JNCC50	Page 649, Section 10.1.10; JNCC welcome the acknowledgement that data gaps exist on the knowledge of the true potential impact of artificial lights on seabirds and that it is not yet possible to assess these in quantitative terms. We welcome the intention of POEPL to: i) develop and implement a Bird Strike Monitoring Programme (BSMP), including awareness training for rig workers and ship crews, and reporting of incidents to FIG; ii) use independent Seabird and Marine Mammal Observers (SMMOs) on support vessels, with reporting to FIG; iii) investigate working with FIG Fisheries Department to establish a seabird distribution monitoring programme; and iv) investigate the practicalities of adopting OSPAR green lighting	POEPL appreciates the point made.	

Consultee	Representation	POEPL response	Details in
	strategy during the project engineering phases, as well as a pilot-free flare design using an automated ignition system.		
JNCC51	JNCC can provide assistance to develop seabird survey, monitoring and assessment programmes. We also welcome the inclusion of monitoring requirements in the EMMP and would be interested in seeing further details as this develops.	POEPL welcomes this offer of assistance and looks forward to engaging with JNCC on this when developing the EMMP further.	
JNCC52	Page 654, Section 10.2.1; The potential for aircraft noise to impact seabird species is not limited to colonies of penguins (see previous comments on the potential impacts to giant petrels).	EIS Section 10.2.4.2.3 does highlight that giant petrels are susceptible to disturbance from helicopter noise. However, POEPL considered that the potential for impacts on penguins were more likely due to the location of colonies and the likely flight-path. Therefore the section focusses on penguins.	
JNCC53	Page 661, Section 10.2.4.2.3; This section focuses on the distribution of helicopter sensitive receptors and details king penguin colonies at Volunteer Point (National Nature Reserve (NNR), IBA) and various species of penguins at Seal Bay (IBA). Meanwhile, Figure 10.7 shows flights to the Sea Lion Field as passing directly over Seal Bay (when departing from Stanley) as well as bordering the 'Very Sensitive Area' at Volunteer Point. It is indicated that for both of these areas, no flights would occur below 3,000 feet as per the Falkland Islands Low Flying Handbook (FILFH) avoidance maps. However, evidence is not detailed demonstrating why this is an acceptable flight height from the point of view of disturbance and given the mass king penguin mortality event reported from South Georgia (Rounsevell and Binns, 1991; Cooper *et al.,* 1994), there is demonstrable cause for concern. Evidence should be included illustrating why this is an acceptable flight height above colonies.	Small aircraft are frequently used to transport people around the Falkland Islands. FIG and MoD have identified sensitive sites and issued guidelines regarding minimum flight heights to avoid disturbing sensitive wildlife. The EIS indicates that these guidelines will be adhered to. The incident concerning king penguin mortality occurred on Macquarie Island, not South Georgia, and was related to the topography of the land surrounding the colony. The flight path shown in EIS Figure 10.7 is 5.5 km from the colony of king penguins at Volunteer Point and there is no reason to believe there will be any impact on this colony. Ideally, helicopters should avoid overflying seabird and seal colonies where practical. There is potential to pass closer to colonies in the Seal Bay area, however aircraft will be above the minimum height stated in the regulations. Studies of king penguins on a	

Consultee	Representation	POEPL response	Details in
		number of sub-Antarctic islands recommend a minimum height that is far lower than the 3,000 ft recommended here (500 ft in many cases).	
JNCC54	In addition, consideration should be given as to whether flight paths above NNRs/IBAs (such as that at Seal Bay and Volunteer Point) can be completely avoided. This is the case primarily for flights from Stanley Airport to the Sea Lion Field. If such flights are unavoidable then monitoring may be required at key onshore seabird sites which are subject to regular over-flights, to demonstrate no significant impacts are occurring.	The flight path shown in EIS Figure 10.7 shows the straight-line route between the heliport and the Sea lion field. As such it represents the most likely (and worst-case) flight path. Therefore, it is anticipated that even the worst-case flight path does not pass over Volunteer Point. As stated in EIS Section 10.2.5, a project-specific flight plan will be developed and approved by FIG.	-
JNCC55	Page 661, Figure 10.7; This figure would benefit from marking Mount Pleasant, Stanley and key sensitive areas by name on the map.	The map has been annotated to provide the place names mentioned in the text in the EIS.	Figure 10.7 amended.
JNCC56	Page 662, Section 10.2.5; The source data for the 'avoid areas' is unknown. Therefore, it is possible that the 'Very Sensitive Area' boundaries may not be sufficiently precautionary. We recommend that the 'full review' mentioned of possible sources is undertaken as soon as possible to ensure that the potential for errors in the assessment of onshore disturbance to wildlife from helicopter use is minimised.	The note beneath EIS Figure 10.7 references the source of the areas marked on the map. This information has been used to manage aircraft movements around the Falklands for many years. The assessment presented is considered to be very precautionary.	-
JNCC57	Page 664, Section 10.2.6.1; This section mentions that traffic will pass *c.* 5.5 km away from the Volunteer Point IBA, but the distance to penguin breeding sites appears much closer than this according to Figure 10.7. This should be clarified.	The stated distance from the king penguin colony is correct (c. 5.5 km).	-
JNCC58	Page 664, Section 10.2.6.1; The text concludes that 'Nonetheless, as the FILFH compliant flight plan will prevent such chronic exposure, the severity of effect of helicopter over-flights is considered to be 'Minor'.' However, we would refer to our previous comments on overlap of flight paths with a number of NNR and IBAs (albeit at considerable height). We recommend inclusion of further evidence demonstrating	The assessment concludes that the severity of effect is 'Minor' which is not the same as negligible. Studies elsewhere on king penguins support the recommendations in the Falkland Islands Low Flying Handbook (FILFH); in fact the minimum flight height is greater than that recommended on many sub-Antarctic islands.	-

Consultee	Representation	POEPL response	Details in
	flight heights at this altitude have negligible effects on seabird colonies before concluding that the severity of effect is 'Minor'.		
JNCC59	Page 666, Section 10.2.12; With respect to Table 10.11, we would query the ranking of 'Low' sensitivity for 'disturbance to wildlife', given the proximity of helicopter use to the main breeding colony of the Falkland Island's king penguin population (at Volunteer Point).	As response to JNCC53, the helicopters will not pass within 5 km of the king penguin colony at Volunteer Point.	
JNCC60	Page 1220, Section 12.1.4.2.5.3; In relation to comments regarding vessel association and albatrosses and petrels, we feel it is unlikely that these species will be as attracted to vessels associated with the Sea Lion development compared with fishing vessels (as they are not discarding fish waste). While they may be attracted to vessel presence initially, they are unlikely to land on the surface of the water (behaviour which is associated with feeding) near these vessels and so may be less likely to suffer from chronic oil pollution associated with vessel traffic. Penguins, however, are a risk from such pollution due to their behaviour and occurrence in the Sea Lion development area, particularly at critical times of year (January and February). As noted, species that spend a large portion of their time on the sea surface or under it (e.g., penguins and shags) are highly vulnerable to oil pollution, both chronic and accidental. Moreover, given the remote location of the Falkland Islands and the difficulty of obtaining manpower and equipment in the short time frame necessary to affect a rapid response to a large-scale seabird oiling event, extreme care must be taken to prevent oiling of birds.	The EIS draws on first-hand observations of seabird association with vessels in the North Falkland Basin, including albatrosses and petrels. These observations come from many years of experience working at-sea around the Falklands, and observations from supply vessels alongside drilling rigs. This section provides an overview of the species that are likely to occur in the NFB and their vulnerability to oil spill and it states that penguins are vulnerable to contamination by oil.	
JNCC61	Page 1224, Section 12.1.4.4.4; Figure 12.13 clearly demonstrates the worst-case scenario for a subsea well blow-out, and potential impact to important bird breeding sites on the north-east coast of East Falkland (e.g., Seal Bay and Volunteer Point). These colonies have the potential to be significantly affected if such an event were to occur during the breeding period. We recognise the unlikely nature of such an event occurring. However, it is worth noting that risky activities should be avoided during critical periods of seabird species annual cycles. Austral summer and winter can be vulnerable times for birds at	Any oil reaching the shore will have been at-sea for several weeks (minimum of 56 days). It is predicted that the oil will be highly dispersed in small masses (waxy particles) and that it will not form a slick. However, uncertainty concerning the long-term impact of these waxy particles has been incorporated into the risk assessment and is reflected in the confidence rating.	

Consultee	Representation	POEPL response	Details in
	sea in the region around the Sea Lion development area (due to their relatively high/very high occurrence in the region).		
JNCC62	Page 1245, Section 12.1.4.4.5; We note the following text: "In the case of a blow-out, it is assumed that any vessels present would support rescue or source control activities for the first 24 hours, and there would be no recovery." And that: "the assumed response has a very modest effect and recovers 9% (2,419 tonnes) of the oil on average". The recovery rate predicted, as a result of a significant accidental oil spill, is extremely low. Hence, the potential for long-term and significant impacts on local seabird populations is high. We also note the limited capacity of the Falkland Islands to undertake a large-scale de-oiling programme for injured/affected birds.	POEPL agrees that the sea states and periods of darkness significantly limit recovery operations, as is experienced in many parts of the world. The assessment takes this into account. In an incident, it will be possible to direct spill response more accurately than the model assumptions, and to areas that pose more risk to seabirds in light of surveillance.	
JNCC63	Dedicated Oil Spill Response Vessels It is still not clear why in-situ burning was not considered as a viable option (i.e., the document mentions the need for FIG consent (Page 133), but this isn't explained in any further detail and seems to have been scoped out of response planning without any explanation). We advise that POEPL provide clarification in Table 4.5 on the scoping out of in-situ burning.	Burning of the Sea Lion crude has not been recommended due to a combination of the difficulty of booming oil for long enough offshore in the expected sea states and, more importantly, due to its low content of volatile (flammable) components making it very unlikely to burn. The possibility of in-situ burning was discounted at an early stage by POEPL's oil specialists due to the very high flash point (> 70 Celsius), low environmental temperatures and non-flowing nature of the oil after release.	
JNCC64	Environmental Monitoring & Management Plan Page 1461, Section 15.5; We welcome POEPL's intention to develop a number of key surveys and data collection programmes related to the key phases of the project to address uncertainties in the EIS that have arisen from lack of baseline data, and which relate to seabirds, including: Seabird monitoring - species distribution prior to operations and throughout field life; offshore and coastal birds around Berkeley Sound, although further work is required to specify more clearly the extent and detail such monitoring will take. Seabirds will benefit from some of the other surveys proposed, including: baseline	POEPL acknowledges the points made on proposed EMMP scope.	

Consultee	Representation	POEPL response	Details in
	measurements of underwater noise in Berkeley Sound, measurements of underwater noise during construction operations at Sea Lion; underwater noise monitoring during LTV and OCV operations in Berkeley Sound.		
JNCC65	Page 1462, Section 15.6; A diagram/framework depicting the governance structure would be useful.	POEPL agrees that governance is very important and expect to define this in more detail with the development of the EMMP document.	
JNCC66	Page 1464, Section 15.6.1.1; Proposed actions for monitoring/managing potential impacts on seabirds resulting from artificial light appear satisfactory. We would be interested in seeing further details as they develop and would be willing to assist where we can. Some questions do remain, however. It would be beneficial to clarify what the response to a large multi-bird strike would be, with many individuals killed in one day or short period. Is there a critical threshold number of birds where operations that may be attracting birds, such as flaring or adverse conditions, would be halted?	The asset will be managed by an experienced Offshore Installation Manager supported by technical expertise including an Environmental Advisor within an HSE team. The issue of potential bird strike is mandated in the operational plans for the FPSO *via* the EMMP and contract documents. In the event of even a single bird strike, the matter will be reported to the HSE team immediately and management steps will be initiated. Many factors will have to be taken into account, but it is highly likely, for example, that if a high flaring rate is associated with bird strikes then, as quickly as safe operations allow, the activities will be suspended pending further information.	
JNCC67	For all bird strikes, will individual birds be identified to species level (i.e., will crew have training in this, or will there be a process for e.g., taking detailed photographs which can be used to identify to species level, if no SMMO on-board at the time of strike)?	The Bird Strike Management Plan will include basic training for key offshore personnel but will rely on photograhic identification and plumage sent to shore for confirmation.	
JNCC68	Sufficiency of survey evidence JNCC acknowledges the existence of several environmental surveys in the vicinity of the Sea Lion field. Given their relevance to the Phase 1 drill centre, it is suggested that more of the results from this survey should be included. As a minimum: • the locations of the 2013 environmental survey stations should be reproduced in greater detail that that shown in Figures 7.4 and 7.5. It	POEPL has amended the figures in the EIS to provide greater clarity. Section 7.2.2. (containing Figures 7.4 and 7.5) introduces the reader to the data sources available. The results of the surveys are cited and discussed in subsequent sections. The EIS summarises the available data throughout and directs the reader to the original	

Consultee	Representation	POEPL response	Details in
	is good practice to include a diagram indicating the surveyed area in the context of the proposed activity and to identify any sample points or the location of photographic evidence. Data provided should also include high resolution acoustic data, video and /or still images • Survey data should provide adequate evidence that habitats and species of nature conservation concern are or are not present.	source should further detail or clarification be required, in line with FIG guidelines. The volume of information available means that it is not possible to reproduce everything in this document and efforts have been made at all opportunities to ensure that the data presented are those which remain key to the actual impact and risk assessments. POEPL has cooperated with the 'South Atlantic Metadata Catalogue' project adminstered by SAERI that publicises available survey data and provides a straightforward means of requesting access.	
JNCC69	JNCC commend POEPL's commitment to carrying out further seabed habitat surveys pre and post drilling as part of their Sealion field development EMMP. JNCC are available to offer further advice on such a plan.	POEPL welcomes this offer of assistance and looks forward to engaging JNCC on this.	
JNCC70	Page 685, Section 10.3.9.1, Paragraph 1; Fisheries within the Sealion field have not been considered as a factor that could influence cumulative impacts on seabed disturbance of the project. It is noted that impacts to fisheries from these activities is included in the disturbance to other users of the sea offshore in Section 11.1. This should be highlighted in Section 10.3.9.1 that impacts to fisheries is considered in Section 11.1.4.2.	Fisheries are very limited in the licence area, however POEPL has made reference to this in the EIS. Specifically it is noted that that fisheries within the Sealion field have not been considered as a factor that could influence cumulative impacts on seabed disturbance of the project. The impacts to fisheries are considered in 11.1.4.2.	
JNCC71	JNCC request that POEPL provide any environmental survey reports relating to the Sealion field development to us when available.	POEPL is happy to share any and all survey data with JNCC, as it has done with FIG, and the majority of the data is also available on the South Atlantic Metadata Catalogue hosted by SAERI and available online. POEPL would be happy to discuss further with JNCC the specific reports that can be supplied.	

Consultee	Representation	POEPL response	Details in
JNCC72	Page 261, Figure 7.5; The scale description is misleading: 1nm equals 1.85km, not 111.12km (which does equate to 60nm). Page 366, Section 7.4.5.2.1.2; In line 2 of this Section, the licence block number referred to in this sentence is missing. Page 372, Table 7.15; Footnote 'c' is missing from the table Page 373, Figure 7.47; The end of the first sentence in the caption is missing (i.e., it just ends with 'tracking data presented in…' and should be included. Page 373, Figure 7.47; This map should include in the legend the time period the tracking represents (i.e., months and breeding periods). Page 374, Figures 7.48 - 7.50; It would be useful to include in the captions that the telemetry data is the blue line, and that the black line is the 200m bathymetric contour that marks the edge of the Patagonian Shelf, as well as the Burdwood Bank. Page 683, Section 10.3.6; The sensitivity, severity and significance are not included for any of the receptors of seabed disturbance in this Section, each paragraph ends with 'is estimated/considered to be.' This is missing from the end of eleven sentence. POEPL should update this Section to include what the sensitivity, severity and significance to each receptor is, as currently this cannot be determined. Page 686, Section 10.3.10; The overall confidence in the seabed disturbance and marine growth assessments is missing from the text. This should be updated to include the confidence level.	POEPL has amended the text and figures in the EIS. Specifically: - The scale in Figure 7.5 has been rectified. - Figure 7.1 has been amended to show the licence block names - A footnote has been added to Table 7.15 - The title in Figure 7.47 has been corrected. - Sections 10.3.6 and 10.3.10 appear to be complete.	Figure 7.1, Figure 7.5, Figure 7.47 and Table 7.15 amended.
Falkland Islands Government Fisheries Department (FIFD)			
FIFD1	It is clear that POEPL took under consideration comments made by the Fisheries Dept during the public consultation when the last EIS was submitted. Generally, we are pleased with the progress made on these points since the last submission and have no further comments to make at this time.	POEPL welcomes this comment and thanks the Fisheries Department for its cooperation.	
Royal Society for the Protection of Birds (RSPB)			
RSPB1	The incorporation of new pinniped and avian data is welcome. This helps narrow risk and current uncertainty on impacts upon vulnerable seabird and marine mammal populations. Nevertheless, we remain	POEPL and partners have made significant investments in the collection of baseline data, offshore, inshore and onshore, in support of the	

Consultee	Representation	POEPL response	Details in
	disappointed that inadequate effort has been made between the exploration and extraction licence applications to gather more offshore baseline ecological data on birds and cetaceans. It remains hard to understand why these gaps could not have been filled by the proponent in the time available.	EIS. For example, the Sea Lion benthic survey covering 92 stations, and the 12-month long PAM surveys conducted prior to the last exploration round were conducted purposefully at a scale that would support a development EIS, and were considerably in excess of what would be expected for exploration drilling. Given the precautionary approach adopted in the EIS, POEPL believes there is ample baseline data on which to draw robust conclusions. The EMMP takes forward further data gathering and monitoring. The EIS does acknowledge data gaps and deficiencies where applicable and the methodology explicitly incorporates uncertainty. The Sea Lion Development EIA process has been guided by local experts *via* the Hydrocarbons Forum and Gap Analysis Projects. POEPL and partners have funded the Gap Analysis Project to identify and help complement project-based knowledge and reduce uncertainty, and available results have been included in the EIS, including using seabird tracking data to complement the 3-year regional seabird programme published in 2002. Satellite tracking of higher predators has been ongoing and the results have recently been amalgamated with data collected throughout the Falkland Islands. The findings of this work have been applied to further colonies in a predictive form to better determine the distribution patterns of seabirds and seals. The initial results of the EU Best sei whale project are included in the ES. Conclusions from a number of recent	

Consultee	Representation	POEPL response	Details in
		projects have been added to the EIS such as Falklands Conservation's sei whale project, and POEPL has striven to include such data up to the last drafting deadlines. POEPL notes the FIG EIS Guidance 3.13: "the applicant should not be accountable for data gaps that could not reasonably have been filled, but more for the way in which they address the gaps in the RA. Therefore the presence of justifiable data gaps does not make an EIS unfit-for-purpose, as long as these are acknowledged and explained. When carrying out the risk assessment data gaps can be taken into account." And 3.18 "where there are data gaps a risk may be increased to reflect the higher degree of uncertainty (and work on a worst-case scenario/precautionary approach)."	
RSPB2	The RSPB considers much of the utilised data too old given the importance of this development and given possible changes in the ecology of the EEZ; for example mooted variation in distribution of keystone species such as Rock Cod and other prey species. Distribution modelling can be useful, but if based on inadequate data, risks giving false impressions upon which decisions are then made. In addition the fact that much of the NFB east of the drill site has no SAST data in sensitive months clearly indicates a significant data gap, particularly when considering impacts from spill events.	Response as above response to comment RSPB 1. Additionally, POEPL would note that Rock Cod is not actually available to seabirds naturally, only when it is exposed as bycatch, and does not qualify as a keystone species. POEPL believes the relevant data is included in the EIS. Seabird data comes from SAST sources, from seismic survey observations and from tracking studies amongst other sources. POEPL acknowledges deficiencies in each dataset and take account of these in the assessment and uncertainties. POEPL believes that the level of data is sufficient for the purposes of the EIS.	

Consultee	Representation	POEPL response	Details in
RSPB3	We agree that the proponent has taken a suitably precautionary approach in their risk assessments. However, these data gaps mean that there is unnecessary uncertainty regarding both the significance of impact on receptors, but also regarding the efficacy of any mitigation measures that are proposed. We believe that FIG needs to ensure these baseline gaps are filled through appropriate consent conditions prior to any operations commencing. These will need to be kept separate from the EMMP. Nevertheless, we believe that it is poor practice that this information is not available to decision makers when taking a consent decision on a major infrastructure project.	POEPL welcomes the acknowledgement that the assessment is precautionary. Our forward programme of work includes seabird and marine mammal observations from vessels, beginning well before First-Oil and during the drilling and subsea installation phases. POEPL expects the EMMP, which includes these commitments, to form part of the overall project approval and would suggest it would be unusual and unnecessary to add specific conditions such as this.	
RSPB4	We welcome the withdrawal of the proposed transfer of crude oil in Berkeley Sound. We view this as a significant de-risking of the proposed inshore operational logistics for the Kidney Island Group Important Bird Area, candidate Key Biodiversity Area for Sei Whales and other sensitive coastal environments. Such internationally designated sites are at the heart of FIG's planning guidance policy for biodiversity.	POEPL acknowledges the comment.	
RSPB5	Bird Strike The RSPB continues to be concerned that there is little detail presented to identify mitigation measures to reduce this potential, which are not dependent on a reaction to in-situ monitoring once vessels are in place and impacts already occurring. We welcome personal presentation from the proponent of a Lighting Design Environmental Impact Study for the FPSO. However, it is not currently clear to us if it forms part of the EIS. While we welcome the study, it remains a preliminary assessment, proposing further study to identify impacts and how to design the FPSO to minimise bird-strike. We look forward to seeing rapid presentation of greater detail, particularly the quantification of impacts and consequent response, in order to offer confidence in a state-of-the-art plan that does not simply use the unambitious and unreliable 'concept of reasonableness' built in to ALARP.	The Lighting Design study is a result of the commitment in the EIS to employ good practice in the lighting design for the FPSO. This is an outcome of the EIS which POEPL has pursued before project Sanction. POEPL is working to build the recommendations into the lighting 'functional design specification' with the FPSO owner and working with our drilling rig and vessel contractors to understand how they can also implement good practices, bearing in mind they are smaller and are present for less time than the FPSO. Another outcome of the previous revision of the EIS was to investigate the feasibility of zero pilot flare, which POEPL has now done in some detail and are close to concluding with the FPSO	

Consultee	Representation	POEPL response	Details in
	As a condition of consent the Proponent should be required to outline in detail measures they will take to reduce artificial light pollution on its operating vessels, platform and FPSO up to state-of-the-art standards. This should include a requirement to investigate and report in a timely way (before production) on the potential for use of non-pilot flares and measures sketched out in the above-mentioned report such as appropriate spectrum lighting, agreed before project implementation.	operator. POEPL believes that the conclusions of the EIS are sound and POEPL has already begun implementing the recommendations. This work will continue after Sanction. This matter is referenced in ExCo Paper 180-18, Appendix A, Section 4.5.3.	
RSPB6	Oil spill response The RSPB welcomes the increase in detail being presented for response to oil spill scenarios and the precautionary nature of the oil spill assessments made in the EIS. The use of Aiuka as a chosen partner is positive. However, we retain some concern that the level of detail for wildlife response does not offer sufficient assurance that response will fulfil the needs of a potentially serious situation with state-of-the-art standards. We are concerned that some proposed aspects risk being seen as 'make-do'. We believe that a condition of consent should be that greater clarity be given regarding the interaction between the proponent's Oil Spill Response Plan and the National Oil Spill Contingency Plan including financing mechanisms and amounts.	POEPL believes the oil spill strategies adequately detail the wildlife response for this stage of the project. Further detail on wildlife response will be developed in the operational OPEPs. POEPL is conscious that RSPB may not be aware of work done on financial liability assessment, and such work contains commercially sensitive information. A Financial Liability Assessment Report has been prepared that is in line with the accepted UK approach to calculating liabilities *via* guidance issued by Oil and Gas UK (OGUK) pursuant to guidance from the Department of Business, Energy and Industrial Strategy (BEIS), which includes the costs of source control, spill response, cleanup and pollution-related damages. This assessment has been submitted to the Department of Mineral Resources (DMR) for consideration. On financial liability, POEPL submits that FIG will decide if adequate provision has been demonstrated at this stage, and FIG will decide what information, if any, to communicate to stakeholders on this topic, such as *via* published	

Consultee	Representation	POEPL response	Details in
		reports to ExCo. This matter is referenced in ExCo Paper 180-18, Appendix A, Section 4.3.14. Detailed work has been done pre-Sanction to make sure POEPL's spill response plans dovetail with the NOSCP including discussions and workshops with the relevant FIG departments.	
RSPB7	As in our previous EIS consultation response, we note that the offshore oil spill scenarios in the EIS factor in oil spill response into their final risk significance values, but that the document then states that due to the weather conditions in the North Falklands Basin, oil spill response is unlikely to be a feasible mitigation option. FIG decision makers need to be cognisant that, although unlikely, should a major spill event occur offshore, there will be very little that can be done whilst impacts occur to globally important seabird populations for which they are responsible.	A major oil spill is an extremely unlikely event and there are many layers of protection built into the design and operations of both the drilling rig and FPSO that control such risks to an extremely low level. As stated in the EIS and Oil Spill Strategies, a major incident will trigger a substantial response that includes many different resources of source control, surveillance, sampling, containment, recovery, wildlife response and organisation. Oil containment and recovery will be engaged and the effectiveness has been predicted in the EIS taking into account real weather conditions. This will mitigate the impact, but a major incident will inevitably have a significant environmental impact, and prevention is key. POEPL believes the risks are clearly stated and assessed, and prevention and mitigation measures are world class. These include Safety Case requirements for the drilling rig and FPSO, Blowout Preventors, independently examined well designs, support vessels equipped with containment and response equipment and an array of onshore equipment for surveillance and wildlife response. In addition, POEPL has access to multiple well capping devices and international oil spill response providers.	

Consultee	Representation	POEPL response	Details in
RSPB8	The RSPB welcomes the presentation of ambition to create a mechanism to offset biodiversity impacts, as required under the Offshore Minerals Ordinance. Furthermore, we understand that it is difficult for the proponent to undertake direct or indirect offsetting themselves. It is very important that these contributions are ring-fenced for conservation projects that benefit the conservation status of species and habitats that are impacted by the project, rather than being part of any wider pot of money.	POEPL agrees with the points raised and the need to link any Environmental Fund contribution to project-related impacts or risks.	
RSPB9	However, it is disappointing that a clear statement is not given to demonstrate either a 'no net loss' or 'net gain' target for biodiversity. This would be in accordance with guidance under the International Financing Corporation Performance Standard number 6. It would be appropriate to outline the scale of financing proposed in order to allow a judgement by decision makers of the potential scale of efficacy of the proponent's scheme.	POEPL would note that the purpose of the EIS is to comply with the Offshore Minerals Ordinance and guidance, which is based on the identification and mitigation of significant impacts. FIG ExCo paper 124-16 addresses developing a policy on further addressing significant impacts *via* offsetting, implying the process is ongoing and linked to reducing significant impacts, which is a different objective to 'net gain'. The paper discussed giving applicants a choice between managing their own projects that are considered offsetting or contributing to an Environment Fund managed by FIG. POEPL has chosen to adopt the Environment Fund approach and is reliant on FIG to deliver the offsetting. The application of this principle has involved considerable discussion. This approach is intended to deliver both offsetting and environmental legacy *via* the environment fund option, which was expressed as FIG's policy preference in the ExCo paper 124-16.	
RSPB10	Likewise it is disappointing that the proponent offers little ambition to deal with average emissions of 440,000 Tonnes/year CO2 equivalent in the Falkland Islands. Recent reports from the IPCC indicate a greater understanding of the two-way link between greenhouse gas emissions	POEPL is committed to protecting and enhancing the environment of the Falkland Islands. POEPL has put considerable effort into minimising greenhouse gas emissions and has prepared Best	

Consultee	Representation	POEPL response	Details in
	and the state of biodiversity. At least several receptors are suspected of being vulnerable to climate change impacts. Given this, there is an increasing recognition of 'nature based solutions' to greenhouse gas mitigation, for which the Falklands may be well suited. There is a possible strong link to species impacted and at risk from the proposed development. We believe a clear commitment to a 'net gain' biodiversity target should be a condition for consent alongside a mechanism for carbon emission mitigation either by the developer or by FIG, or jointly.	Available Technique assessments on its gas turbines, flare system and low pressure ('flash gas') gas compression systems to select low emissions solutions. To avoid flaring we have designed-in reinjection of excess gas, recovery of low pressure flare gas and recovery of tank vapours on the FPSO, and we are investigating the elimination of a pilot flame on the flare system. POEPL recently considered greenhouse gas emissions across the entire portfolio and confirmed in early March 2020 that the company will aim to achieve carbon neutrality in relation to Scope 1 and 2 emissions, per the GHG Protocol, on all new projects. A significant component of efforts to achieve carbon neutrality on Sea Lion will be secured through verifiable carbon offsetting. ExCo paper 124/16 Section 5.11 acknowledges that carbon offsetting is unlikely to be fully achieved within the Falkland Islands, and that supplementary international schemes are likely to be required. POEPL's research to date confirms that this is the case however, POEPL will prioritise locally based projects against international schemes where they are practicable and effective. POEPL acknowledges the reference in ExCo paper 124-16 to undertaking both biodiversity offsetting and carbon offsetting and will facilitate Falkland Island nature based biodiversity and carbon offsetting schemes through the	

Consultee	Representation	POEPL response	Details in
		environmental fund. It is intended that in pursuit of carbon neutrality offsetting of residual volumes of carbon will be administered internationally by POEPL using verifiable, where possible, Gold Standard schemes from a central, POEPL group wide, 'net zero' fund. POEPL will encourage applications to the group net zero fund for additional Falkland Islands nature and infrastructure based offsetting projects, and will work with proposers to achieve the required levels of assurance and certification for such schemes. This approach is consistent with ExCo paper 124/16 which confirms that adopting the environment fund approach does not prevent an operator from seeking alternative 'more hands on' offsetting.	
RSPB11	As outlined in our previous consultation response, for the reasons set out above, the RSPB does not believe that the EIS as it currently stands allows FIG decision makers to make a fully informed decision on a licence application. However, if a decision is taken to consent the project we strongly recommend that robust conditions address these issues prior to operations commencing.	POEPL would note that the EIS embeds a wide range of commitments into the project and submits that specific conditions should be kept to a minimum lest they imply that some commitments are are more important than others.	
Falklands Conservation (FC)			
FC1	Non-Technical Summary (NTS) as a decision making tool: The NTS needs to clearly include the pertinent points of the risk assessment, including the key components required relevant to legislation and policy, such as impacts on globally important sites, cumulative impacts, and satisfactory alternatives.	The NTS reproduces the risk assessment summary and references marine and terrestrial conservation sites. The contents of the NTS are specified in the Offshore Minerals Ordinance Schedule 4 Article 2, and POEPL believes that the Sea Lion NTS complies with that requirement.	
FC2	Legislation and policy: In order to present a good assessment in a way that decision-makers can assess compliance against FIG policy, the impacts need consideration in the context of relevant biodiversity legislation and wider policy.	The EIS lists applicable legislation in some detail in Section 3.1, including policy in Sections 3.1.5.1 and 3.1.5.2. POEPL would refer to the Legislative Compliance	

Consultee	Representation	POEPL response	Details in
		Review undertaken for DMR by SAMS as evidence that the EIS is compliant with the legal requirements.	
FC3	Data: Data presented needs to be made relevant, important data gaps need to be filled before sanction (seabirds and cetaceans) and existing relevant data needs to be included, such as Key Biodiversity Areas and other designations for biodiversity and nature conservation.	The EIS does acknowledge data gaps and deficiencies where applicable and the methodology explicitly incorporates uncertainty by taking a precautionary approach in each assessment, and by applying a confidence rating. The Sea Lion Development EIA process has been guided by local experts *via* the Hydrocarbons Forum and Gap Analysis Projects. POEPL and partners have funded the Gap Analysis Project to identify and help complement project-based knowledge and reduce uncertainty, and available results have been included in the EIS, including using seabird tracking data to complement the 3-year regional seabird programme published in 2002. Satellite tracking of higher predators has been ongoing and the results have recently been amalgamated with data collected throughout the Falkland Islands. The findings of this work have been applied to further colonies in a predictive form to better determine the distribution patterns of seabirds and seals. The initial results of the EU Best sei whale project have been included in the EIS. Conclusions from a number of recent projects have also been added to the EIS, such as Falklands Conservation's sei whale behavioural study. POEPL sought to include such data up to the last drafting deadlines. We note the FIG EIS Guidance 3.13: "the applicant should not be accountable for data gaps	

Consultee	Representation	POEPL response	Details in
		that could not reasonably have been filled, but more for the way in which they address the gaps in the RA. Therefore the presence of justifiable data gaps does not make an EIS unfit-for-purpose, as long as these are acknowledged and explained. When carrying out the risk assessment data gaps can be taken into account." And 3.18 "where there are data gaps a risk may be increased to reflect the higher degree of uncertainty (and work on a worst-case scenario/precautionary approach)."	
FC4	Oil Spill Response Planning (OSRP): The OSRP should be assured as deliverable prior to sanction and the interface between PMO's OSRP and the NOSCP, if there is one, should be clear. Provision of finer details could be conditioned at sanction though should not be part of an EMMP. PMO need to guarantee resource and funding for an appropriate response. This needs to include costs of remediation, and holding birds until remediation is sufficiently complete and retaining sufficient resource and equipment to initiate a response, not rely on volunteers.	Operational details and specific reporting structures will be included in the operational OPEPs in due course. POEPL is conscious that FC may not be aware of work done on financial liability assessment, and such work contains commercially sensitive information. A Financial Liability Assessment Report has been prepared that is in line with the accepted UK approach to calculating liabilities *via* guidance issued by Oil and Gas UK (OGUK) pursuant to guidance from the Department of Business, Energy and Industrial Strategy (BEIS), which includes the costs of source control, spill response, cleanup and pollution-related damages, has been submitted to DMR for consideration. POEPL submits that FIG will decide if adequate provision has been demonstrated on financial liability at this stage, and FIG will decide what information, if any, to communicate to	

Consultee	Representation	POEPL response	Details in
		stakeholders on this topic, such as *via* published reports to ExCo. This matter is referenced in ExCo Paper 180-18, Appendix A, Section 4.3.14.	
FC5	Environmental Monitoring and Management Plan (EMMP): Work that should have been done pre-sanction, should not be put into the EMMP document which will be live during the whole length of the campaign.	POEPL believes that sufficient information is included in the EIS for a competent decision to be made on approval of the project. Considerable amounts of baseline data have been added to pre-oil datasets and specific gaps have been identified, and priority gaps filled, *via* the 'Gap' Project and through surveys conducted specifically for the Sea Lion project. The EIS incorporates all this data and has been updated in respect of many recent studies that were not available to the previous revision. POEPL believes the scopes of work identified for the establishment and continuation of the EMMP are separate to this, and that a competent timetable has been put forward for them.	
FC6	Offsetting: The EIS needs to make a clear commitment to offsetting, which if delivered by payments, needs to be determined by biodiversity impacts, not other factors. The EIS needs to lay out how net gain for biodiversity will be achieved.	The EIS discusses offsetting clearly in Section 8.9. We believe the EIS is compliant with the Offshore Minerals Ordinance which is based on the identification and mitigation of significant adverse effects, and which requires offsetting for those significant adverse effects to be considered after applying other layers of reduction and mitigation. The Environment Fund contribution provides the means by which a biodiversity offset can be achieved *via* projects identified by FIG/the Environment Trust that are relevant to the Sea Lion project significant impacts and risks.	
FC7	Decommissioning: Remediation plans should be included within the EIS.	It was agreed with FIG that in this EIS POEPL would provide a high level description of measures taken in design to facilitate	

Consultee	Representation	POEPL response	Details in
		decommissioning, but that a full plan and assessment of the impact of decommissioning will be undertaken near the end of the field life. It is considered that this approach is consistent with Offshore Minerals Ordinance (Amendment) 2011 – Section 6. Remediation. This is also the current approach on the UKCS (BEIS EIA Guideline, Feb 2018), "There is no requirement to provide detailed information in relation to how removal will be achieved at the time of abandonment or decommissioning, or to provide a demonstration of the likely significant effects of the activities." At an early stage it was agreed with FIG Environmental Planning Department (EPD) and DMR that: • In summary, a high level description will be given with a base-case of complete removal of all structures. However, due to uncertainty as to how that will be achieved and potential for technological developments, it is not meaningful to assess the impact of the removal process at this time. A full plan and assessment of the impact of decommissioning will be undertaken near the end of the Field life. This is the approach taken in the UK. • It was agreed in principle by all that this was reasonable and would comply with the current ordinance. It is typically required that operators must have financial provision to cover decommissioning	

Consultee	Representation	POEPL response	Details in
		costs and it is normal for them to demonstrate this periodically to the regulator, and we expect this to be covered in the Field Development Plan. This obligation would transfer to any new owner along with the licence. This matter is referenced in ExCo Paper 180-18, Appendix A, Section 4.12.	
FC8	The document layout weakens the assessment quality by complicating the process and access to pertinent data. This would be aided by grouping relevant information within specific Sections, rather than striping through multiple Sections and appending supporting data rather than including in main body.	POEPL believes the EIS is clearly and consistently laid out and the NTS provides simpler summary information. The EIS is inevitably a large document covering many issues in detail. The document deliberately does not have any appended supporting data, as POEPL felt that this demotes important information and reduces transparency. By grouping the baseline data into a single chapter, readers can see a consistent account of the environment in one place, without duplication.	
FC9	NTS as a decision making tool: The NTS provides a summary of the key components/requirements of an EIS that is accessible to non-technical readers. By admission even key stakeholders do not have capacity to read beyond the NTS to make assessment of the current EIS – the EIS being too technical or too large. This is of significant concern. The NTS in itself highlights some of the issues with the EIS, and FC have concerns that due to capacity and/or the complexity of the main document, that this Section will be used in faith to make significant decisions. If that is the case, decisions based on the NTS should be looking to see whether it demonstrates a desire to achieve no net loss or net gain, or comply with good practice or broader policy. FC believe these elements are missing. For example: · The NTS does not include key elements of the EIA as laid out in the OMO and standard practice namely cumulative impacts, satisfactory	Inevitably for the First-Oil production in the region, the EIS is a large document describing much data and analysis. This befits the importance of the issues and the need to be transparent about the basis for the assessment. POEPL has made public presentations of the EIS and made itself available for discussion and questions voluntarily during the consultation period. When requested, POEPL provided FC with a list of significant changes between this version and the previous version of the EIS to assist their review. See FC1 for other comments.	

Consultee	Representation	POEPL response	Details in
	alternatives · The NTS states the EIS only aims to comply with EIS guidance and POEPL HSE policy. Why not other relevant policy? · Key risks are not identified. The NTS only partially identifies relevant globally important sites for biodiversity, missing candidate IBAs offshore and candidate KBAs inshore. It does not summarise an assessment of the specific risks to such sites. · NTS states the use of industry standard practice not leading practice. · NTS fails to commit to offsetting that will achieve 'net gain', or even 'no net loss' for biodiversity or carbon neutrality.		
FC10	A good EIS will consider its compliance with legislation and wider policy (there seems to be some confusion between regulation, legislation and wider policy within the document) and identify where its actions need to comply with, or can positively contribute to, policy objectives. There is some consideration, mostly for polluting legislation, but little for biodiversity. For example the development proposal may run contrary to FIG Development Plan Policy SP5 in having impacts on key species and sites. The EIS does not appear to address requirements under SP5 Sections D1 and D2, so at present it does not make a case for being compliant with FIG policy.	See response to comment FC2. The purpose of the EIS is to identify and address potential significant impacts and risks such that they are minimised. POEPL believes the EIS is compliant with the Offshore Minerals Ordinance and that there is no conflict between complying with the Offshore Minerals Ordinance and complying with Development Plan Policy SP5. In response to SP5, we believe the EIS demonstrates a minimisation of impacts on the environment (A), includes impacts on species and sites protected by law (D1), and demonstrates that alternatives have been considered (D2).	
FC11	Identification of key data requirements and collection of data has been poorly approached and/or prioritised. Key data (such as the seabird data) that are being used, are too old for the risk assessment to be considered in accordance with good practice. Some recent data are also not robust in terms of effort (coastal bird surveys). Key data that are available are not being used, such as for globally significant sites for biodiversity. Significant data gaps still exist.	See response to comment FC3.	
FC12	The data on seabirds is too old, it is difficult to see how models using near 20 year old data can be argued as up-to-date (a good practice requirement). It is the baseline data on which an assessment of the	See response to comment FC3. Seabird data is described in detail in Section 7.4.5 of the EIS. The main source of offshore seabird	

Consultee	Representation	POEPL response	Details in
	value/sensitivity of the bird assemblage that falls within any Zone-of-influence (ZoI) is based. It is critical to understand what birds are currently using the area, even if this only covered the core spill area initially, this should have been collected before sanction (to accord even with standard practice). Spill models for some impacts extend way beyond the Falklands EEZ, but no data for this part of the ZoI have been provided. Whilst penguins may be more readily exposed to oil, prevailing spill coverage will certainly cover areas used by species with higher threat categories (IUCN Red List) such as Atlantic petrel (Endangered), Tristan albatross (Critically Endangered), etc. and these species certainly influence the significance of impacts and the types of offsetting proposed.	data has been independently reviewed, described in EIS Section 7.4.5.2.1.1.	
FC13	Designated sites are one of, if not the most important, risk assessment tools and considerations. They are the most obvious representation of areas that are of international, national or local significance for biodiversity. They are widely identified in national legislation and policy as requiring special considerations of impacts, often avoidance, as any significant impacts are globally significant. The OMO schedule 5 states that 'sites or areas that have an international designation, need to be taken into account in deciding whether projects might have a significant effect on the environment' (sec 2 cl 8). Good practice (CIEEM guidance) is to consider candidate sites as fully designated sites – this is actually a legal requirement in UK and EU. The EIS still fails to properly account for such sites, nor does it acknowledge Key Biodiversity Areas (terrestrial or candidate marine) and candidate marine Important Bird Areas (IBAs). There is no specific risk assessment of such sites even where mentioned i.e., Kidney IBA. This is surprising given that, instead of subjective interpretation of heat maps of distribution data, the internationally accepted criteria mean that important areas are delineated based on key features making impacts easier to assess. Also, that specific mention of possible marine management areas is included, which is less progressed than designated or candidate globally important sites for biodiversity.	See response to comment FC3. These candidate marine protected areas have not yet achieved an official status. Nevertheless POEPL has recorded and taken account of the conservation status of relevant flora and fauna affected by the project e.g., EIS Section 7.4.5.5, and identified features that are merely of conservation interest e.g., Section 7.4.3.3.4. Impacts to the species involved have been predicted and included in the impact and risk assessments. POEPL will of course comply with any future requirements that may arise from the protected area designation process, but given that the EIS already considers the entire flora and fauna and the project's interaction with them, we do not envisage that this would significantly affect the EIS conclusions. POEPL is engaged in local fora such as the OHEF and Gap Project and participates in consultations on conservation issues and legal developments.	

Consultee	Representation	POEPL response	Details in
FC14	Data presentation – using an overall baseline Section is not helpful. Data presentation should be focussed by defined Zones-of-Influence for impacts (such as Oil Spill Modelling, or vessels operating areas), rather than geographical areas such as the North Falkland Basin, and therefore sensitivities of receptors are not always evaluated appropriately by the presented data i.e., a summary table across all areas and taxa for sensitivity.	See response to comment FC3. This is a logical and established structure which gives a complete picture of the environment.	
FC15	Data gaps have been long-evident in key areas, yet investment in information gathering that has taken place in this time has not achieved filling such key data gaps for an EIA, which could and should have been achieved prior to any sanction. Data gap priorities are not necessarily being driven by key receptors or indeed data collection by its suitability for EIA improvement, such as globally significant sites or threatened or vulnerable species or habitats. Baseline data, such as the presence or absence of key species within a ZoI, are a basic requirement to make any risk assessment, whereas risk refinement data (how much oil may adhere to fur for example) are significant principally to the developer in demonstrating a reduced risk.	See response to comment FC3. The EIS contains a great deal of data and the whole development process has included significant original data gathering on benthic populations, marine mammal presence and behaviours, underwater noise and mammal vocalisations, offshore seabirds, inshore bird distributions, inshore seabed surveys, non-native species monitoring, and onshore noise. POEPL acknowledges the viewpoint that the EIA could be structured or presented differently in terms of 'zones of influence'. However, we have chosen not to use this approach in efforts to prevent repetition and to contain all assessments of the sensitivity of receptors within the relevant zone of influence to the specific impact/risk assessment chapters. POEPL believes that the EIS presents a clear and coherent assessment of impacts and risks. For each impact or risk topic, the assessment Section discusses the relevant affected receptors with reference back to the baseline data Section. Testing the adherence of Sea Lion crude oil to fur remains a commitment of the EIS.	
FC16	Oil Spill Response Planning: It is welcome that the EIA still acknowledges that 'remoteness, poor transport and abundant wildlife	See response to comment FC4. A major oil spill is an extremely unlikely event and	

Consultee	Representation	POEPL response	Details in
	in the Falklands pose unique and significant challenges in responding to major oil pollution incident, and that in the worst-case scenario weather conditions will be such that effective recovery of oil spills would not be possible. Under this scenario, impacts would be significantly detrimental to the Falklands' environment and wildlife, as well as the economies driven by it (e.g., international wildlife tourism)'. It is important to recognise that whilst very unlikely, a major oil spill in the Islands may well represent a more damaging prospect than in other locations with regard to spill response.	there are many layers of protection built into the design and operations of both the drilling rig and FPSO that control such risks to an extremely low level. As stated in the EIS and Oil Spill Strategies, a major incident will trigger a substantial response that includes many different resources of source control, surveillance, sampling, containment, recovery, wildlife response and organisation. Oil containment and recovery will be engaged and the effectiveness has been predicted in the EIS, taking into account real weather conditions. This will mitigate the impact, but a major incident will inevitably have a significant environmental impact, and prevention is key. POEPL believes the risks are clearly stated and assessed, and prevention and mitigation measures are world class. These include Safety Case requirements for the drilling rig and FPSO, Blowout Preventers, independently examined well designs, support vessels equipped with containment and response equipment and an array of onshore equipment for surveillance and wildlife response. In addition, POEPL has access to multiple well capping devices and international oil spill response providers. Via a separate process, POEPL is required to demonstrate its ability to fund a spill response and compensate for damages for worst-case incidents.	
FC17	The announcement of Aiuká as PMO's wildlife responders is very welcome, providing many years of very relevant expertise in the field. It is also positive that spill plans follow IPIECA guidelines, though it	See response to comment FC4. The Stanley Harbour Oil Spill Strategy relates to marine diesel only, which is very difficult to	

Consultee	Representation	POEPL response	Details in
	would be improved if Stanley Harbour plan was approached in a consistent fashion with similar details to Offshore and Inshore ones.	contain or recover, versus larger scale risks in Berkeley Sound or offshore. The Stanley Harbour Strategy is therefore scaled to those activities.	
FC18	FC are concerned that elements of this work have been pushed back into the EMMP. Whilst further details of Oil Spill Response Planning could be conditioned to occur ahead of any oil, this should be separate from EMMP. For good practice it is still vital that plans contain sufficient real commitment to deliver a response prior to sanction; however, some non-critical detail could be conditioned. Recognition of the issues that can occur with lack of early detail on OSRP are borne out by FIG guidance in that the Hydrocarbons Environmental Impact Assessment Guidance Note states that 'A key risk is oil spill.', and that 'the approval of the EIS without understanding the broad approach to how a spill event would be responded to [] has previously led to considerable delays in the approval of EIS'.	See response to comment FC4. POEPL would note that the EIS embeds a wide range of commitments into the project and does not see the need for further specific conditions. POEPL believes the EIS does indeed give understanding of "the broad approach to how a spill event would be responded to".	
FC19	In the absence of information on adherence of oil on fur or likelihood of ingestion, response plans should assume and be resourced and ready to deal with worse-case oiling to wildlife	See response to comment FC4. Testing of the adherence of Sea lion crude oil to fur remains a commitment, which will remove a small uncertainty in terms of the potential impact and ability to respond; meanwhile a precautionary assessment has been made. Ingestion of oil is discussed several times e.g., Section 12.1.4.2.5.2 for seabirds. Laboratory testing of the oil has indicated generally low toxicity for the oil due to its low PAH content and low soluble oil content e.g., Table 12.1. Adherence to feathers has been tested and is relatively low.	
FC20	There needs to be guarantee that an oil spill response and remediation programme can be financed by the developer. This will need to provide details of specific cover – e.g., clean-up *vs.* remediation which is potentially more expensive– and financial details rather than a simple assurance. The length of any remediation	See response to comment FC4.	

Consultee	Representation	POEPL response	Details in
	programme will influence the ability to release cleaned birds from the rehabilitation facility and this potential for prolonged holding of birds needs to be able to be accommodated and financed.		
FC21	Successful delivery of the Plans will be very dependent upon the nature of any 'interface' with NOSCP. In this regard, the exact nature of delivery needs to be determined in terms of which resource will be drawn upon by who and when. The NOSCP may not in fact deliver a level of response suited to an industry spill of the potential scale possible. There is no question that any effective response would need a minimum of resource, facility and people, and that using volunteers who may or may not be available or committed at any time, is not a reliable approach. Whilst there are likely to be full-time paid first-aiders to deal with Health and Safety issues there appear to be no full-time paid responders. An oiled wildlife response workshop should have been held ahead of plan formulation, and should certainly not fall under EMMP.	See response to comment FC4. This is more an organisational matter rather than a matter for environmental impact assessment, nevertheless it is very important to ensure the mitigation of an oil spill, and POEPL has had ongoing discussions with the relevant authorities and a number of meetings and workshops to present and test its plans in open dialogue with FIG DMR. We have put forward relatively detailed Oil Spill Strategies that set out the relationship between the POEPL plans and the NOSCP and which describe the resourcing for wildlife response including maintaining a core competency on-island as well as access to emergency responders from Brazil (Aiuka) in addition to other international responders.	
FC22	EMMP: It is welcome that it is identified that many of the responsibilities likely required for the EMMP, such as observers, need to be independent. Unfortunately, the EMMP is being used as a vehicle to deliver work elements that should have been achieved pre-sanction or as separate conditions post-sanction. A number of work elements include 'baseline' – these should clearly have been done as part of the EIS if directly attributable impacts could occur through the proposed development.	See response to comment FC5. The establishment of a monitoring programme requires a slightly different dataset to the baseline required for an EIA. POEPL believes the EIS has competent baseline data that includes some extensive original data gathering and analysis, enabling the significance of impacts to be predicted and mitigation measures to be evaluated. Monitoring moves onto some very specific determinands and locations to identify potentially subtle changes in amongst potentially high natural variability. It is natural that some baselining for monitoring purposes is conducted,	

Consultee	Representation	POEPL response	Details in
		which is not necessary for the impact assessment.	
FC23	Decommissioning: It is understood that this would be dealt with by another EIA. However in the OMO, it states that the EIS must address remediation of the project.	See response to comment FC7.	
FC24	It is positive that a mechanism for offsetting exists in an Environment Fund. Unfortunately, as the principle document setting out the impacts of the proposed industry there is little consideration of offsetting in the EIS. It is understood that it is difficult for PMO to undertake offsetting themselves directly, however, the NTS summarises that POEPL do not have the inclination to do offsetting, despite this being the key mechanism by which to achieve 'no net loss' if residual impacts are predicted for either biodiversity or carbon emissions. For biodiversity impacts, offsetting by financial contribution without scheme proposals is not seen to be good practice. There is no guarantee within the EIS that offsetting will occur to achieve 'no net-loss'. Rather the EIS states that the level of financial contribution will be made in relation to a whole range of factors, not one of which is the impacts on biodiversity or the carbon produced, for which offsetting is required. At the moment the EIS does not set out a development proposal that does anything other than deliver environmental impacts and makes no commitment to 'no net loss' let alone net-gain (which is now increasingly as standard). Whilst this may not be the ultimate intention of PMO there is no evidence to ensure otherwise at this point.	See response to comment FC6. POEPL has chosen to fulfil its offsetting obligations using the Environment Fund option, which is one of the recommended means given in FIG ExCo paper 124-16, and which was expressed as FIG's policy preference. POEPL understands, and firmly expects, that this fund will deliver offsetting *via* projects that are clearly linked to significant impacts or risks of the Sea Lion project. The EIS process under the Offshore Minerals Ordinance is founded on the identification and mitigation of significant adverse effects, and it requires offsetting for those significant adverse effects to be considered after applying other layers of reduction and mitigation. The Environment Fund contribution provides the means by which a biodiversity offset can be achieved *via* projects identified by FIG/the Environment Trust that are relevant to the Sea Lion project significant impacts and risks.	
Peter Carey (PC)			
PC1	One of the worst-case scenarios considered is of a well blow-out lasting 29 days. A duration of only 29 days seems very short to qualify as a "worst-case scenario", given that there are examples of oil wells that have continued to spew oil into the marine environment for many months (e.g., Ixtoc 1, in 1979), and for many years (Taylor Well, 2004-present). It therefore seems the modelling presented for this kind of	The historic wells mentioned did not have the design prevention, operational controls or contingency planning that is present on this project. Since the Macondo incident in 2010, worldwide capability in major blowout prevention and response has increased very substantially. POEPL employs all North Sea	

Consultee	Representation	POEPL response	Details in
	environmental threat is a gross underestimate of the worst that could happen if there is a blow-out at a Sea Lion project well.	standard prevention approaches such as a blowout preventer and has access to multiple capping devices that can be flown into the basin and installed rapidly. More details on oil spill response planning for major incidents are given in the Offshore Oil Spill Strategy. POEPL has investigated the logistics necessary for mobilising and transporting this equipment to the Sea Lion field and estimates that a capping device could be installed in 14 days, with an upper estimate of 29 days, which has been used as a worst-case in the current revision of the EIS. This is in line with UK requirements for oil spill planning published by the Department of Business, Energy and Industrial Strategy (BEIS).	
PC2	In addition, has any consideration been given to how environmental damage could be minimised if the drilling platform and/or FPSO were attacked as a result of war or armed conflict?	The risks of environmental damage from drilling and FPSO operations are mitigated through a comprehensive programme of prevention and emergency response that meets good oil field practice and North Sea standards. The wells are protected by blowout preventers which are designed to prevent the release of hydrocarbons to the environment from the reservoir. The drilling rig and the FPSO are both floating facilities and can be removed from the field quickly if necessary. POEPL considers that the risk of armed conflict is very low and the facilities have no special features to address this eventuality. Nevertheless, standard oil field mitigations will be in place for Sea Lion, which provide many layers of control for acute events. POEPL will continue to engage with relevant authorities to ensure that security considerations	

Consultee	Representation	POEPL response	Details in
		in relation to Sea Lion operations are monitored, that appropriate mitigation and response plans are in place and regularly exercised.	
PC3	p. 119 – "Consideration of Alternatives" – Has there been consideration for the alternative of not extracting oil from this basin? I recognise that for an oil company like POEPL this is not attractive, but it is a real alternative. For FIG, the "no extraction" option should be one of the alternatives considered.	FIG Policy is to support hydrocarbons development, and POEPL responds to many different drivers in selecting prospects to explore, develop and invest in. This aspect of the 'consideration of alternatives' process is above the level of the EIA process, which is designed to examine specific project proposals.
